Sant'Anna

# **Robotics Class - Final Projects**

## MSc in Computer Science

2016

# Project no. 1    (*Desogus – Marini – Moratilla*)

## AIBO Search & Rescue

Visually guided exploration of a maze. The robot must be able to fully explore a maze and search for “victims” painted on the walls.

Skills: control architectures, navigation, computer vision

Tools: AIBO robot + libraries, URBI middleware

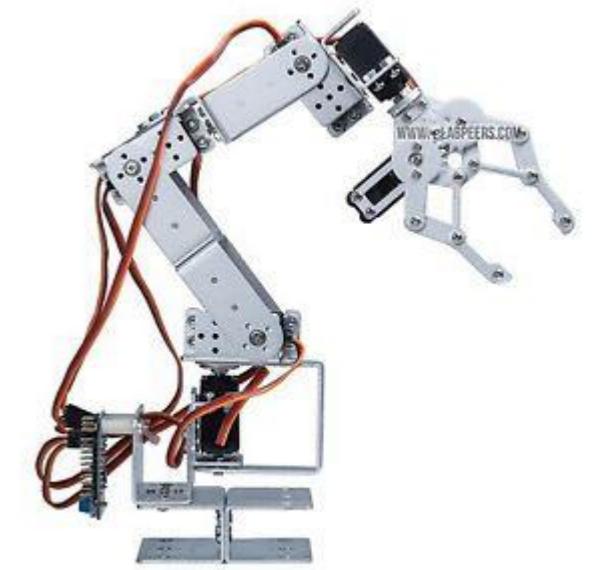

Expected results: Live demo of the AIBO robot performing in a previously unseen maze

Contact persons: L. Vannucci ([L.vannucci@sssup.it](mailto:L.vannucci@sssup.it)) , M. Calisti ([m.calisti@sssup.it](mailto:m.calisti@sssup.it))

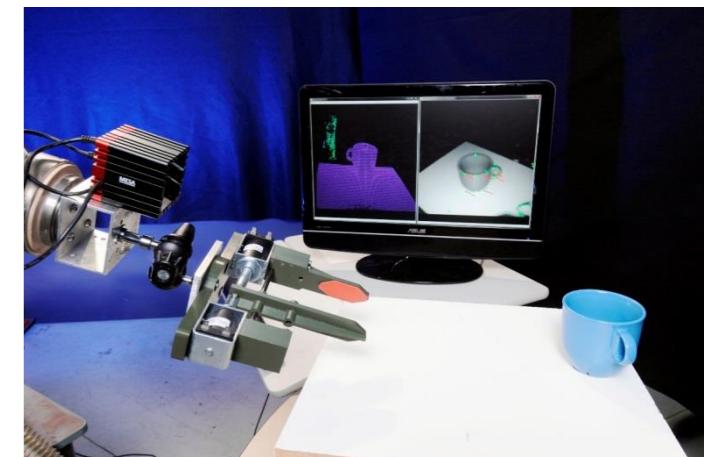

# Project no. 2 (*Cecconi – Loddo*)

## Building a robotic arm for pick and place

Assembling of a robotic manipulator using servomotors. Definition of direct and inverse kinematics for the development of the controller. Implementation of low level joint control and high level visually guided end-effector positioning.

Skills: robot kinematics, control, computer vision

Tools: MATLAB, camera, Arduino, servomotors

Expected results: the manipulator must be able to pick and place object using visual input.
