Sommario della lezione

- Principi di base della visione retinica
- Alcune proprietà delle immagini retiniche
- Le relazioni matematiche tra immagini retiniche e cartesiane
- La foveazione
- Una testa robotica antropomorfa
- Esempi di applicazione in robotica

Riferimenti bibliografici:

(edge)

The Retina-like Giotto cameras

- Technology: 0.35 micrometer CMOS
- Total Pixels: 33193
- Geometry:
 - 110 rings with 252 pixels
 - 42 rings with a number of pixels decreasing toward the center with a "sunflower" arrangement
- Tessellation: pseudo-triangular
- Pixels: direct read-out with logarithmic response
- Size of photosensitive area: 7.1mm diameter
- Constant resolution equivalent: 1090x1090
- On-chip processing: addressing, A/D, output amplifier

Le relazioni matematiche

From standard image to log-polar image

$$\rho(x, y) = \begin{cases} (F - 1) + \log_{\lambda} \left[\left(F - \frac{1}{2} - \sqrt{x^2 + y^2} \right) (1 - \lambda) + \lambda \right] & \text{if } \sqrt{x^2 + y^2} > (F - \frac{1}{2}) \\ \left(\sqrt{x^2 + y^2} + \frac{1}{2} \right) & \text{if } \sqrt{x^2 + y^2} < (F - \frac{1}{2}) \end{cases}$$

$$r(\rho) = \left[\left(F - \frac{1}{2} \right) + \lambda \frac{1 - \lambda^{\rho - F}}{1 - \lambda} \right] \text{ if } \rho > F$$

$$\theta(x, y) = \frac{\Theta}{2\pi} \cdot \arctan\left(\frac{y}{x}\right) + \frac{\Theta}{2} + \text{Shift Factor}$$

$F=42$
 $P=152$
 $\Theta=252$
 $X=545$
 $Y=545$
 $\lambda=1.02314422608633$

F = size of the fovea in rings.

P = total number of rings.

Θ = maximum # of pixels in each ring.

$2X$ = horizontal size of the cartesian image.

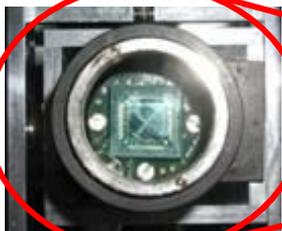

$2Y$ = vertical size of the cartesian image.

ρ = ring number in the log polar image.

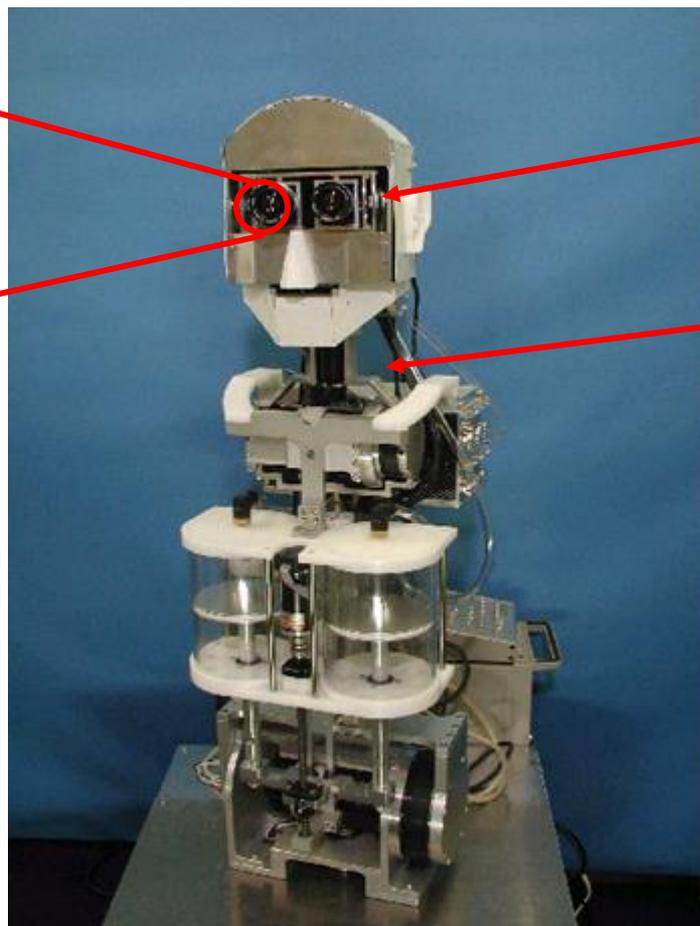

θ = angular polar coordinate.

Retina-like vision for visuo-motor co-ordination of a robot head

WE-4 robotic head with Giotto cameras

*Retina-like
Giotto cameras
by the
University of
Genova, Italy*

3 dof for eye movements

4 dof for neck movements

*WE-4 robotic head by
Takanishi Lab, Waseda
University, Tokyo, Japan*

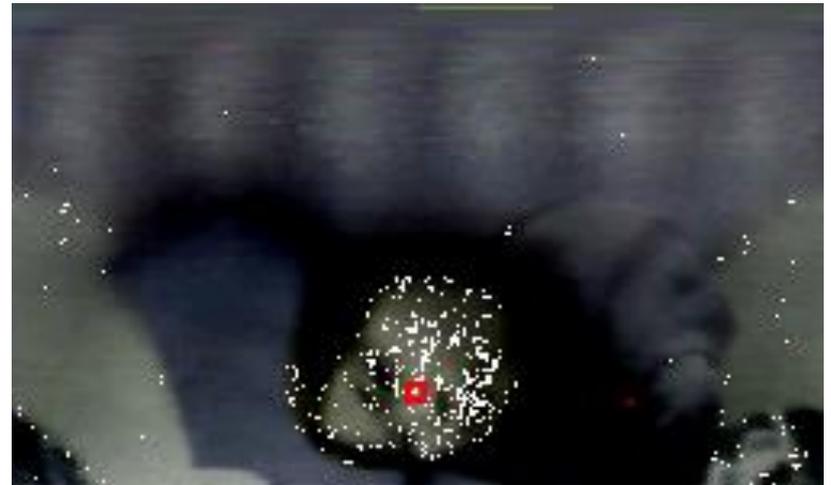

Face detection by hue

Hue = information on the color

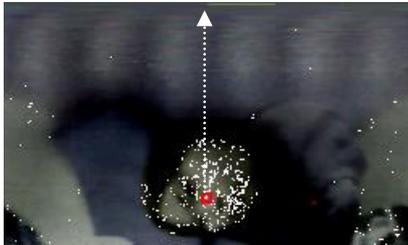

$$\text{Hue} = \cos^{-1} \left(\frac{(R - G) + (R - B)}{2\sqrt{(R - G)^2 + (R - B)(G - B)}} \right)$$

if $B > G$ then $\text{Hue} = 2\pi - \text{Hue}$

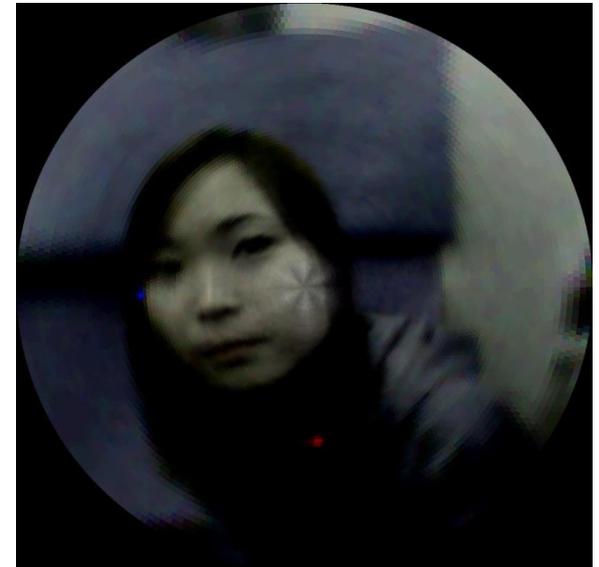

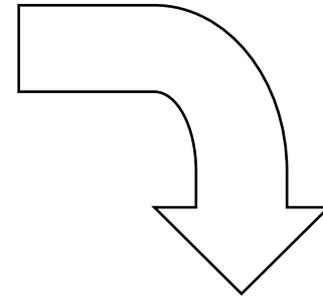

R, G, B = RED, GREEN, BLUE components, respectively

An example of foveation

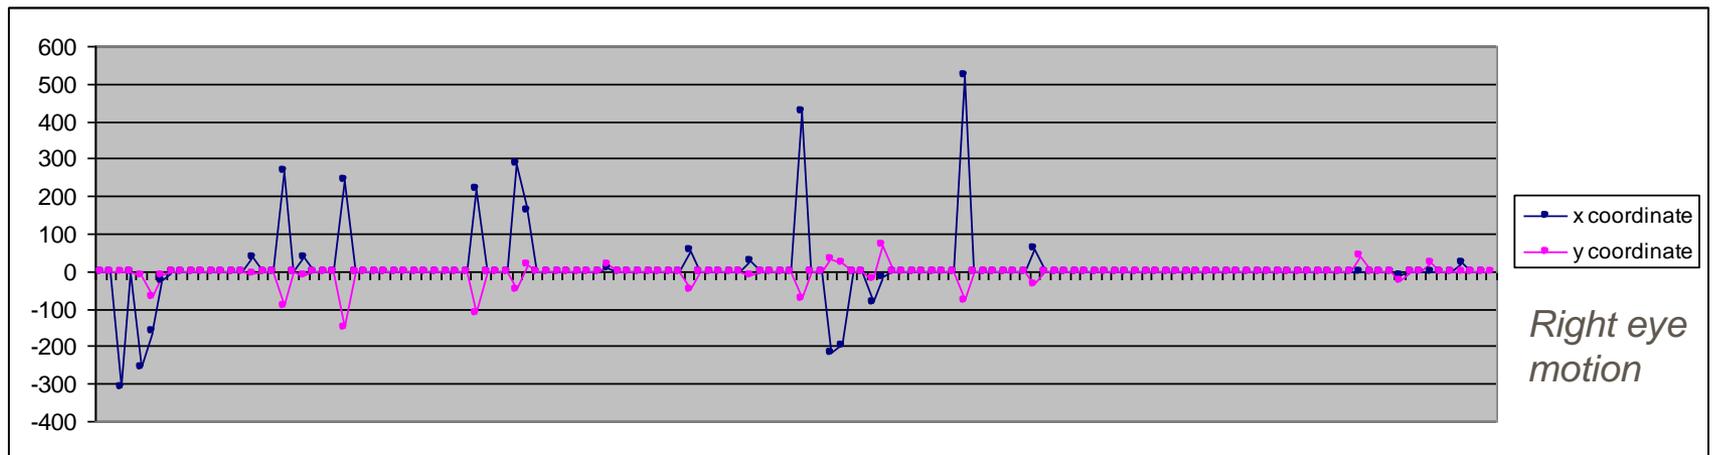

Eye/neck movements

Proportions are rescaled for display purposes

Experimental trials

Example of design and development of
a human-like robotic head

**The ARTS humanoid robot
head**

Synthesis of characteristics of the human oculo-motor system

- Eye movements:
 - Saccades
 - Vergence
 - Pursuit
- Ranges of motion:
 - 120° for the tilt eye movements
 - 60° for the pan eye movements
- Eye speed:
 - Up to 900°/sec (in saccades)
- Inter-ocular distance: between 60 and 80 mm

[Thibodeau & Patton, 1996]

Examples of algorithms developed for retina-like image processing

- Acquiring standard image
- Creating log-polar image from standard image
- Creating retina-like image from log-polar image
- Thresholding of image based on RGB and HUE
- Computation of the centroid of a thresholded area
- Edge detection
- Line detection

Simulation of retina-like cameras and basic image processing

- Acquiring standard image
- Creating log-polar image from standard image
- Creating retina-like image from log-polar image

Thresholding of image based on RGB and HUE

The screenshot displays the PALOMA Robotic Artefact Control Panel software interface. The main window is divided into several sections:

- Left Panel:** Contains control buttons (Start, Close, Setting Video Format, Setting Cam Prop) and a list of image processing options: Original Image (checked), Log Polar Image (checked), Retina-like Image (unchecked), Smoothing (unchecked), Thresh (100, checked), Edge Detection (75, unchecked), and Hough (unchecked). It also includes a Left Image Server section with Address (PALOMA1), Port (8000), and Connect/Disconnect buttons, and a Grab Image section with a Grab button and a table of image data.
- Image Processing Results:** A central area showing a sequence of images: the original camera view of a table with colored blocks, a vertical strip of the image, and two circular regions of interest (ROIs) around a yellow block, one with a red circle and one with a blue circle.
- Right Panel:** Contains control parameters for the robot's head and joints. It includes a Head Control section with Remote Address (HEAD), Remote Port (8000), and STATUS: CONNECTED. Below this are buttons for Disable, Enable, and Calibrate. The Foveation and Tracking section includes Bar. Pos. (Right Ro 5, Th 164, Left Ro 4, Th 62), Tracking (unchecked), Velocity (checked), and Position (unchecked). The Joint Position section includes a table for joint positions (J0-J6) and velocity (Vel) for Read and Move operations. The Cartesian Position section includes a table for X, Y, Z coordinates for Read and Gaze operations. The Head Neurocontroller section includes a table for X, Y, Z coordinates and buttons for Clamped Joints and Value Joints.

Foveation and tracking of borders of object and reconstruction of the geometry of the object

Retina Like image

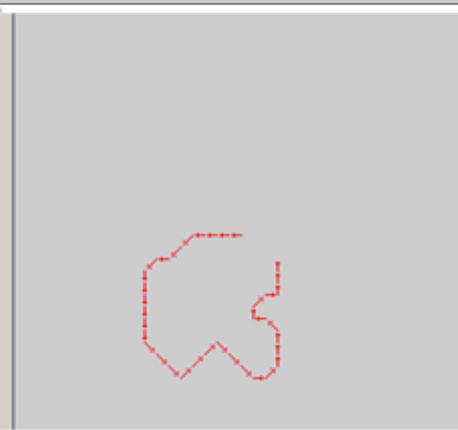

Log Polar Image

Edge of log polar image

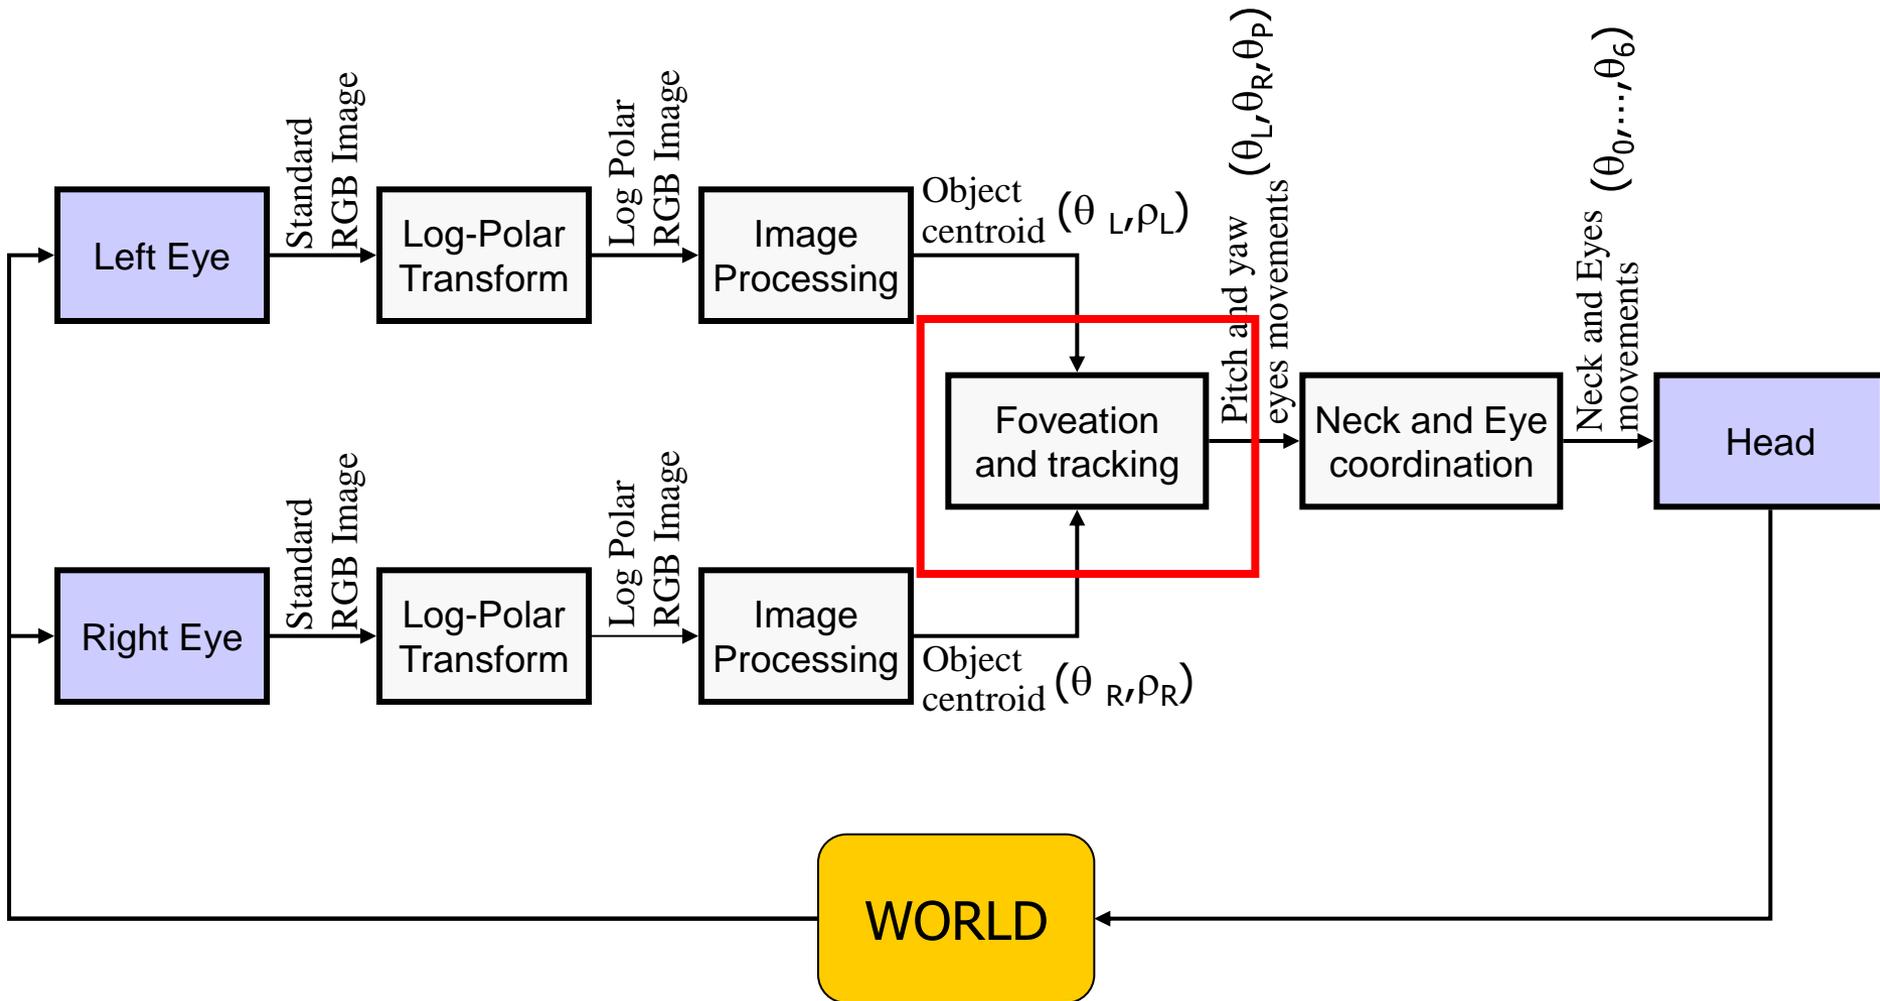

Detected lines (Boundaries)

Boundary reconstruction based on eye positions

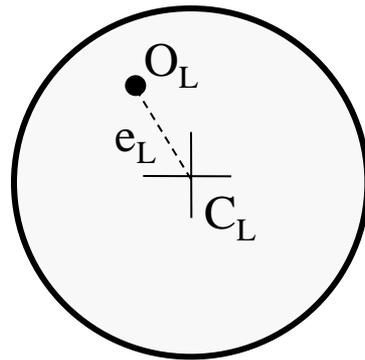

Overall sensory-motor scheme of the visual apparatus

Foveation of the object centroid

Proportional control based on the visual error

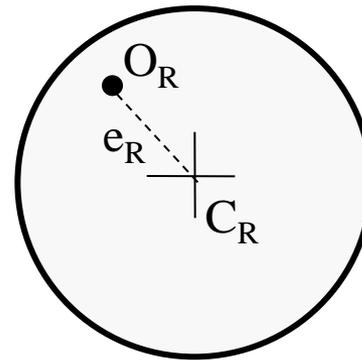

Left Image

$$O_L = (\rho_L, \theta_L)$$

$$e_L = \rho_L / M_{r0}$$

Right Image

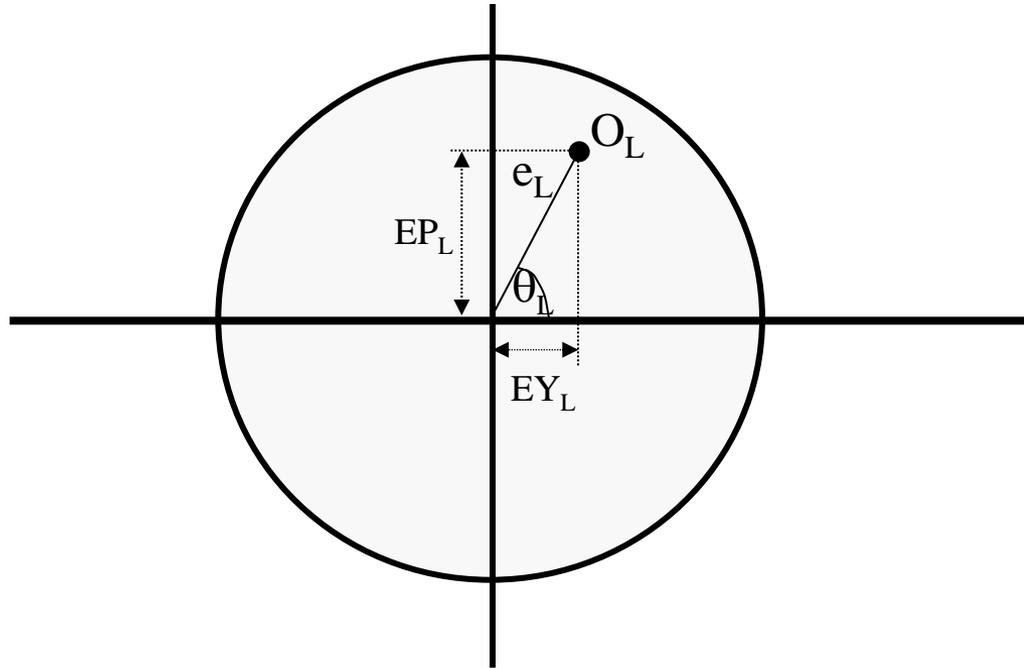

$$O_R = (\rho_R, \theta_R)$$

$$e_R = \rho_R / M_{r0}$$

M_{r0} is the maximum ρ value (i.e. 152)

Computation of yaw and pitch eye movements

$$EY_L = e_L * \cos(\theta_L) * P_L$$

$$EP_L = e_L * \sin(\theta_L) * P_L$$

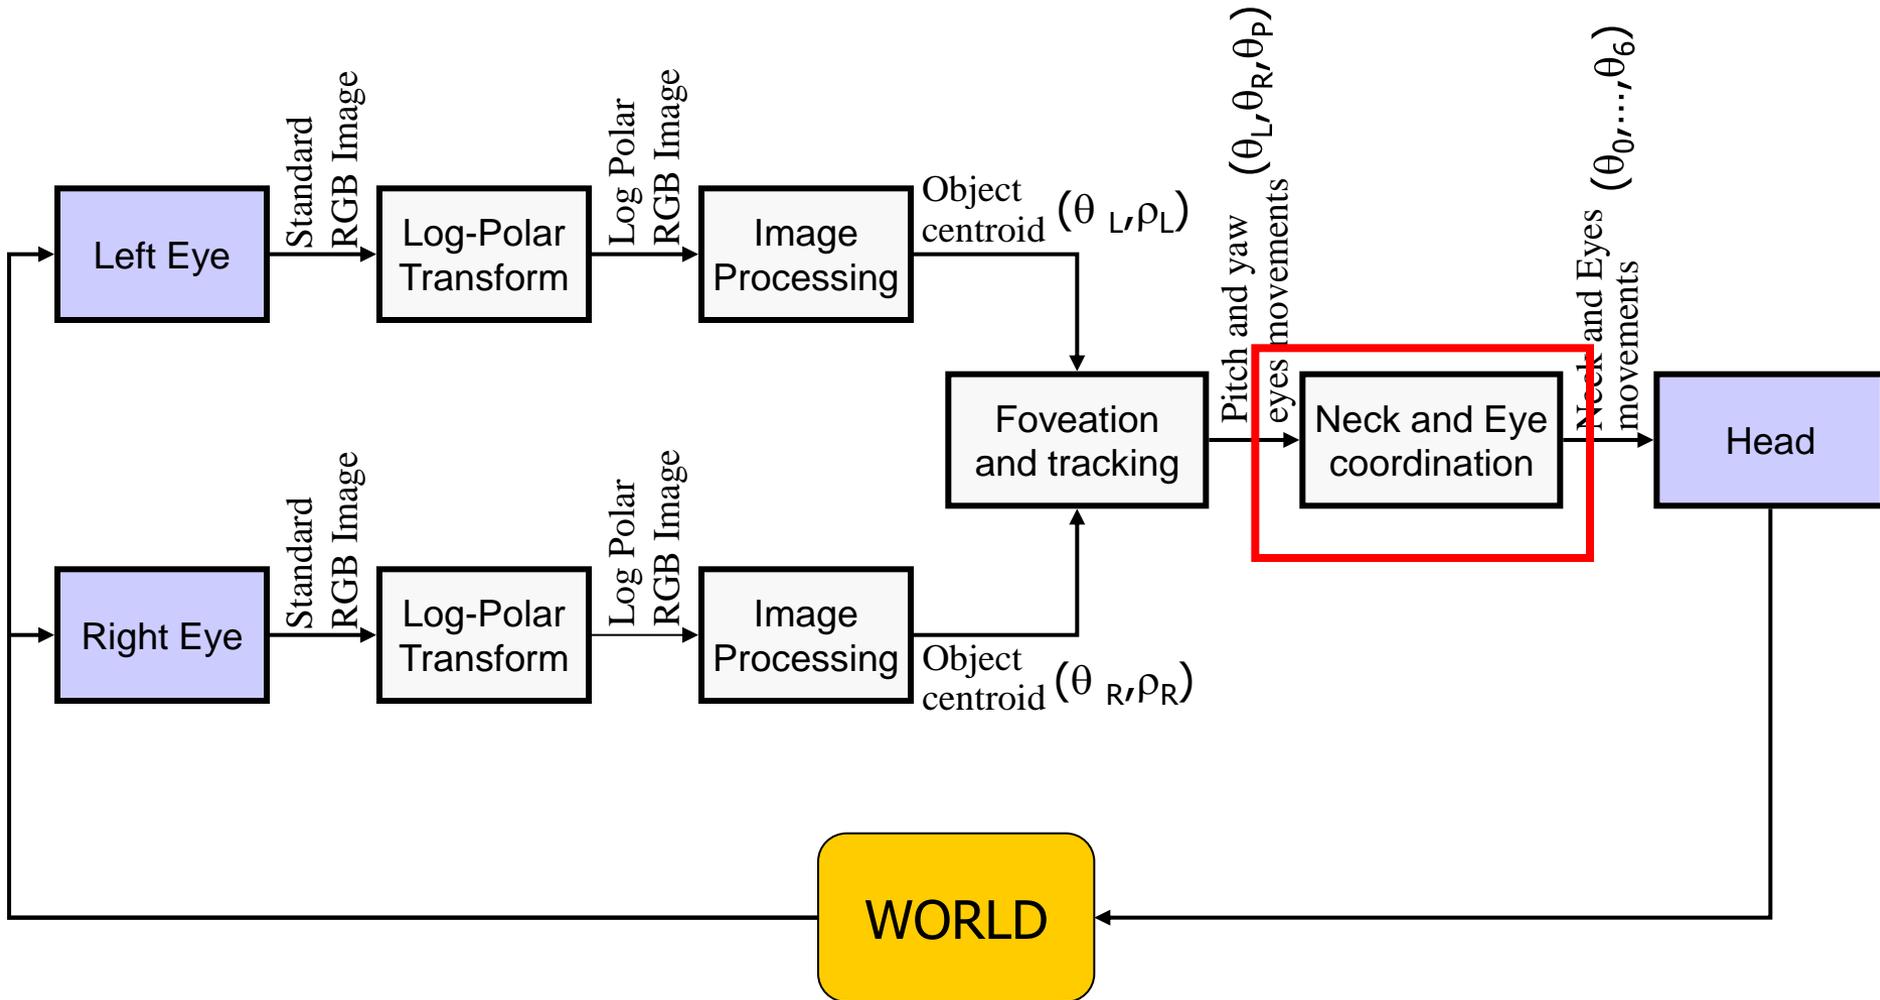

$$EY_R = e_R * \cos(\theta_R) * P_R$$

$$EP_R = e_R * \sin(\theta_R) * P_R$$

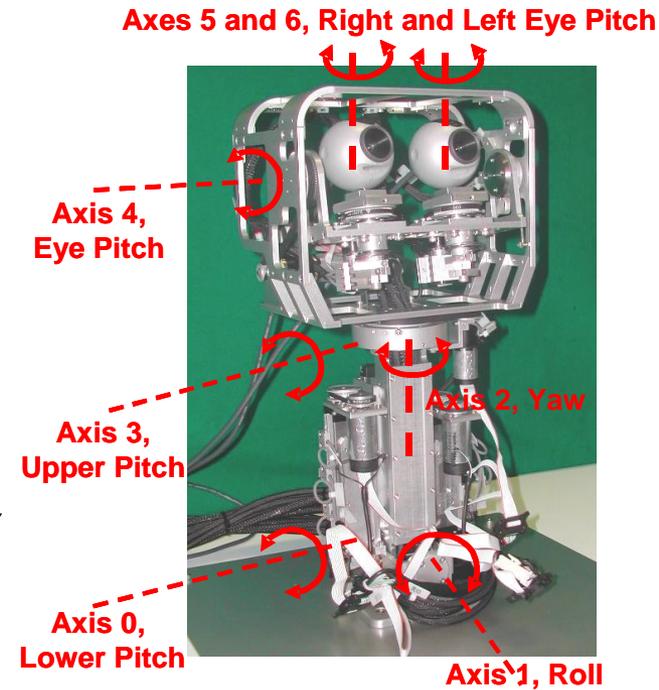

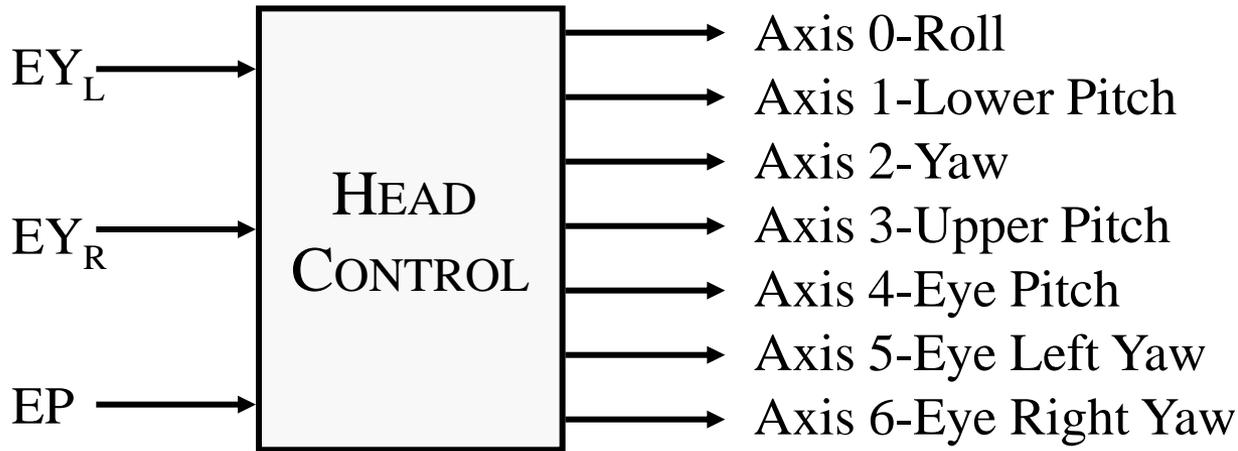

$$EP = (EP_L + EP_R) / 2$$

P_L and P_R are the proportional parameters for left and right eye, respectively.

Overall sensory-motor scheme of the visual apparatus

Eye-neck coordination

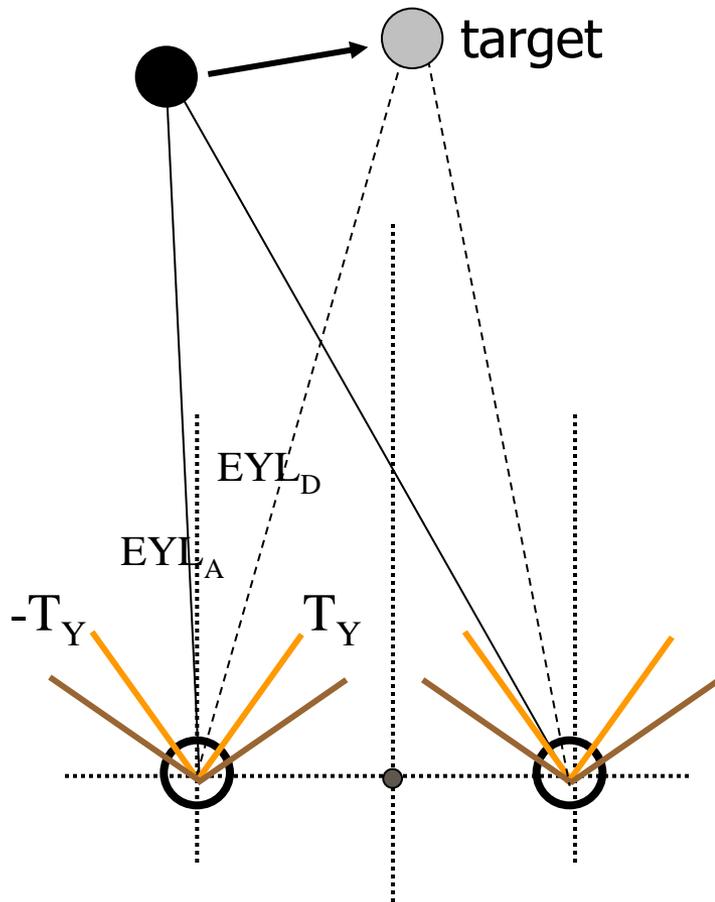

Solution 1

**Distribution of the
movements between the
neck and eye DOF**

Strategy for the coordination of neck and eye movement (yaw)

- If the movement is small, it is executed by the eyes, only

$$EYL_A + EYL_L < T_Y$$

and

$$EYL_R + EYL_R < T_Y$$

Left Eye Yaw

$$EYL_D = EYL_A + EYL_L$$

Right Eye Yaw

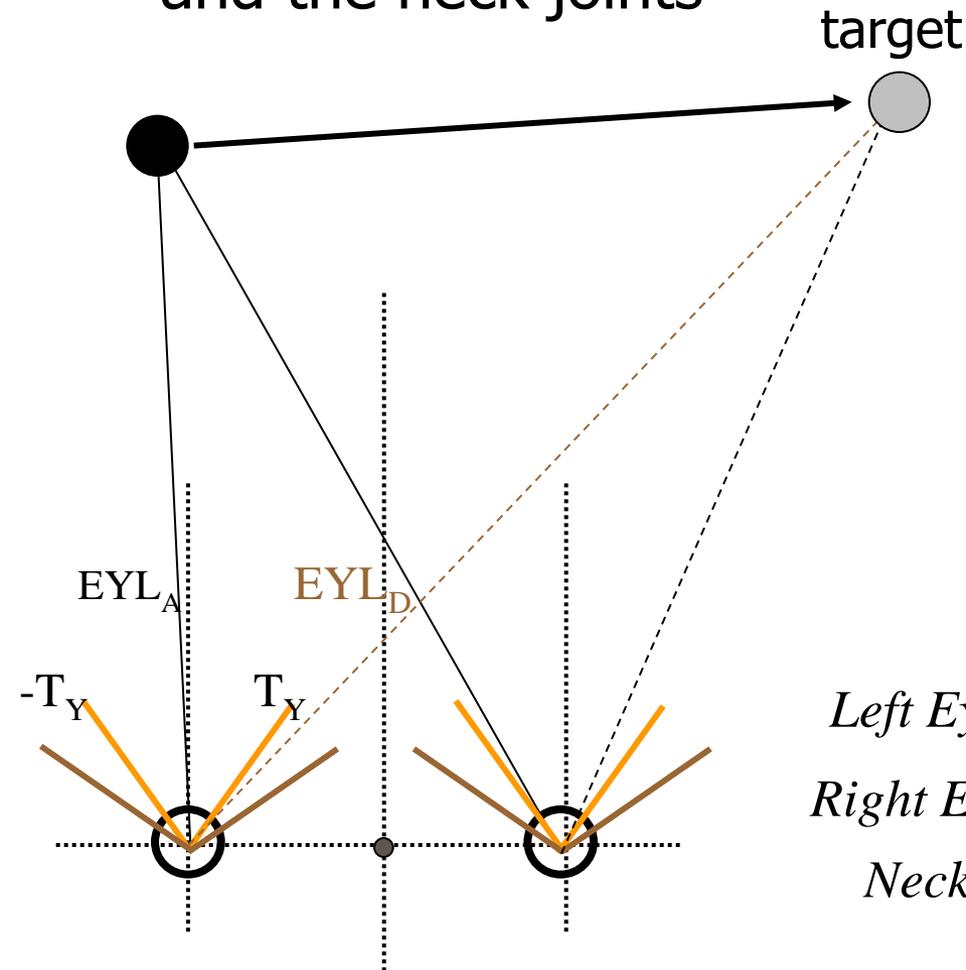

$$EYL_D = EYL_R + EYL_R$$

Neck Yaw

$$YAW_D = YAW_A$$

Strategy for the coordination of neck and eye movement (yaw)

- If the movement is larger, it is distributed among the eyes and the neck joints

$$EYL_A + EYL_L > T_Y$$

or

$$EYR_A + EYL_R > T_Y$$

Eyes and neck

$$\theta = \text{atan}((\tan(EY_L) + \tan(EY_R))/2)$$

Left Eye Yaw $EYL_D = EYL_A + EYL_L - \theta$

Right Eye Yaw $EYL_R = EYL_A + EYL_R - \theta$

Neck Yaw $YAW_D = YAW_A + \theta$

Strategy for the coordination of neck and eye movement (pitch)

Eye, upper and lower pitch of the head are calculated as a percentage (proportional to the available range) of EP.

$$K1 = EP * EYP_{AV} / P_{AV}$$

$$K2 = EP * UP_{AV} / P_{av}$$

$$K3 = EP * LP_{AV} / P_{av}$$

$$EYP_D = EYP_A + EP * K1$$

$$EUP_D = EUP_A + EP * K2$$

$$ELP_D = ELP_A + EP * K3$$

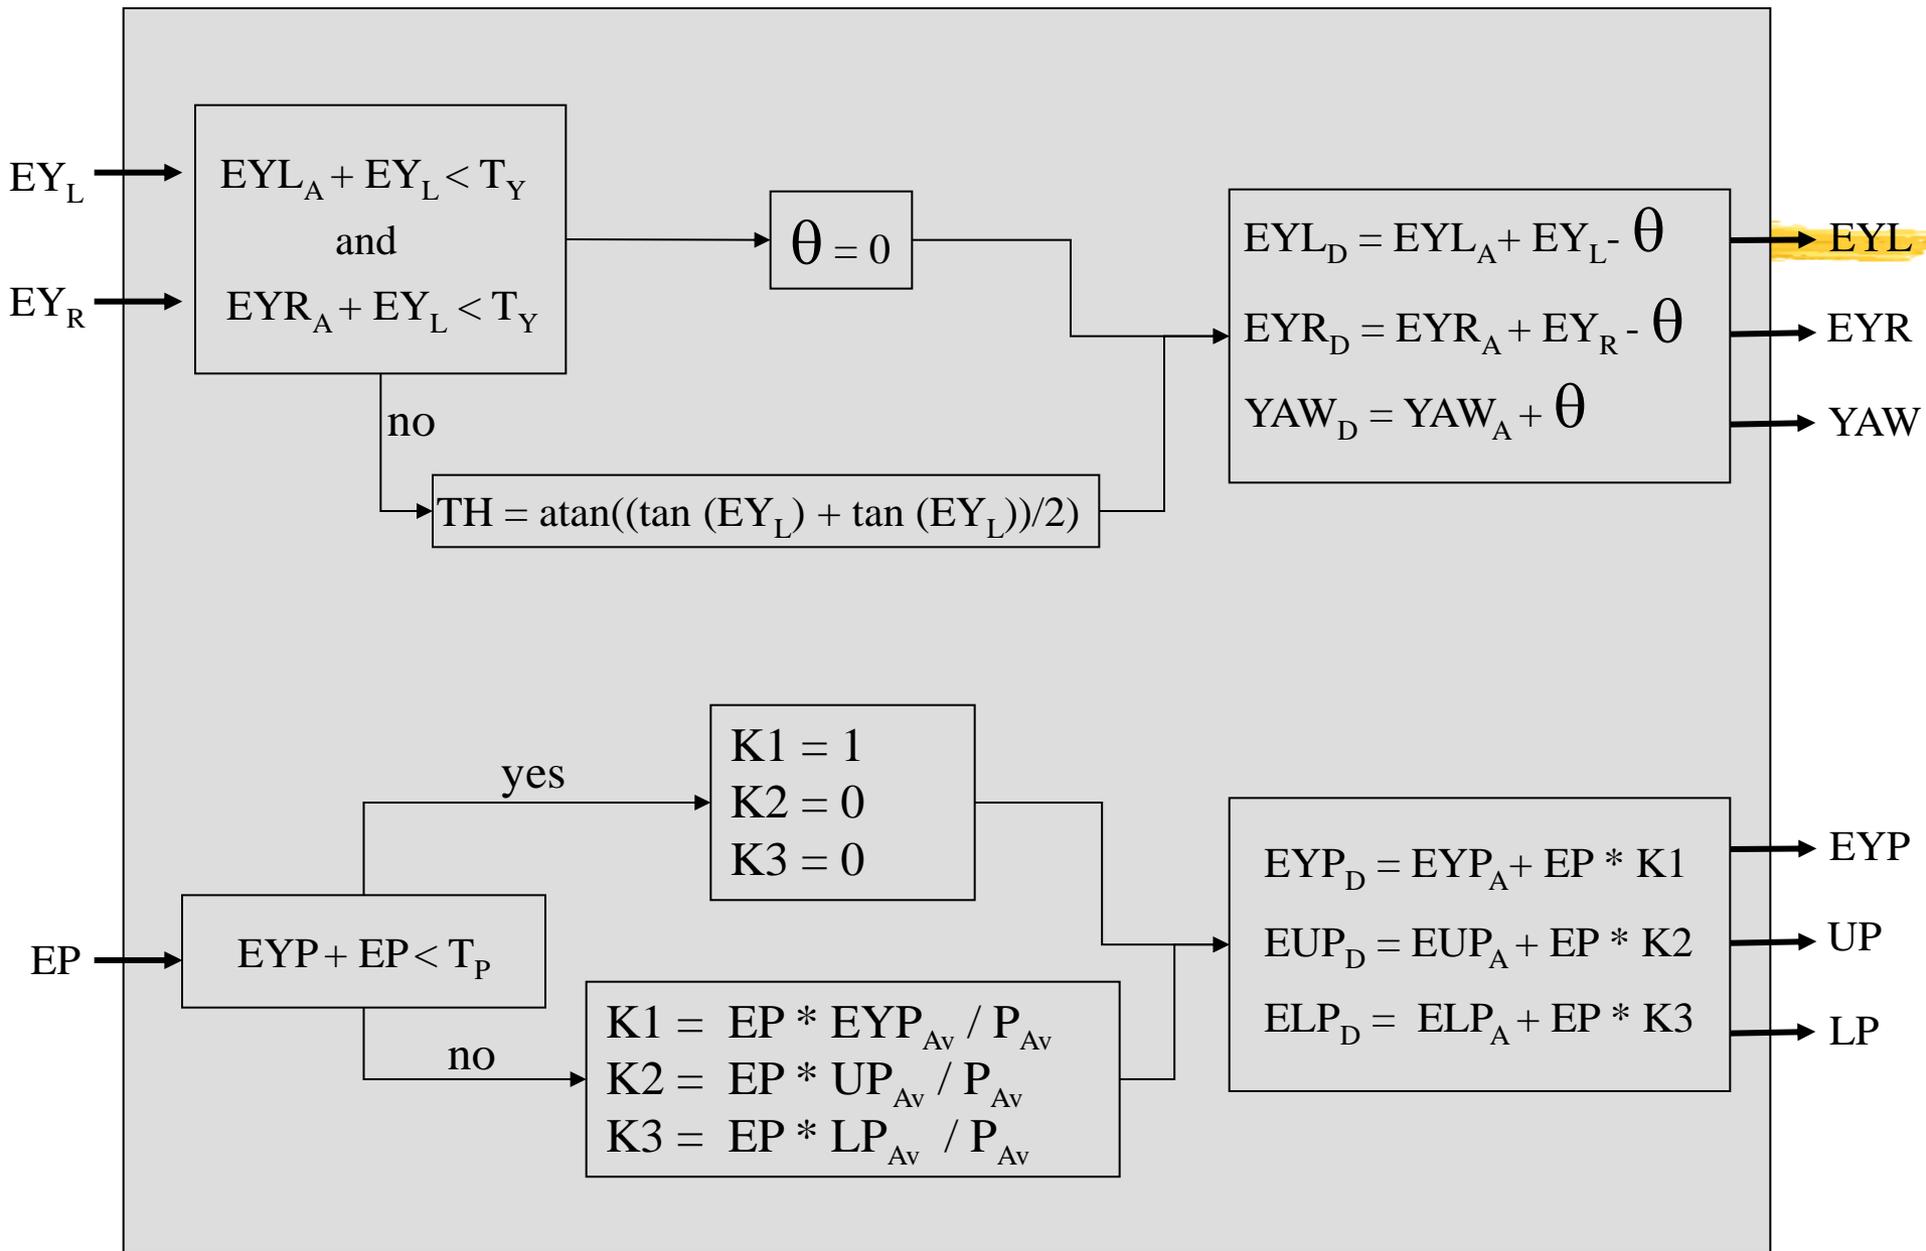

$$EYP_{AV} = EYP_M - EYP_A$$

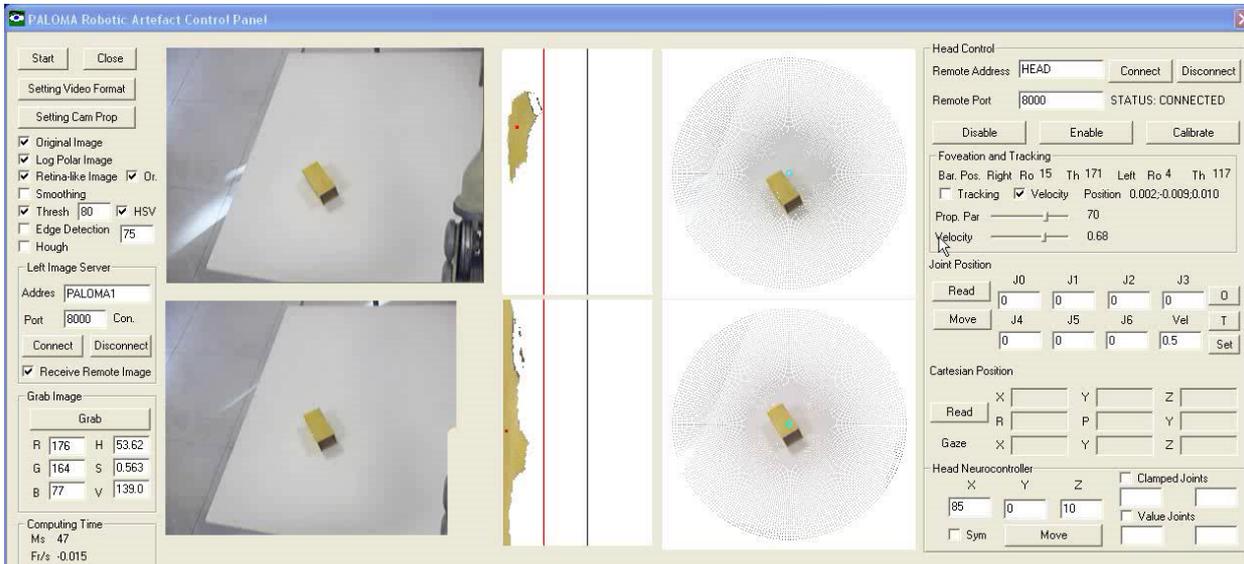

$$UP_{AV} = UP_M - UP_A$$

$$LP_{AV} = LP_M - UP_A$$

$$P_{AV} = EYP_{AV} + UP_{AV} + LP_{AV}$$

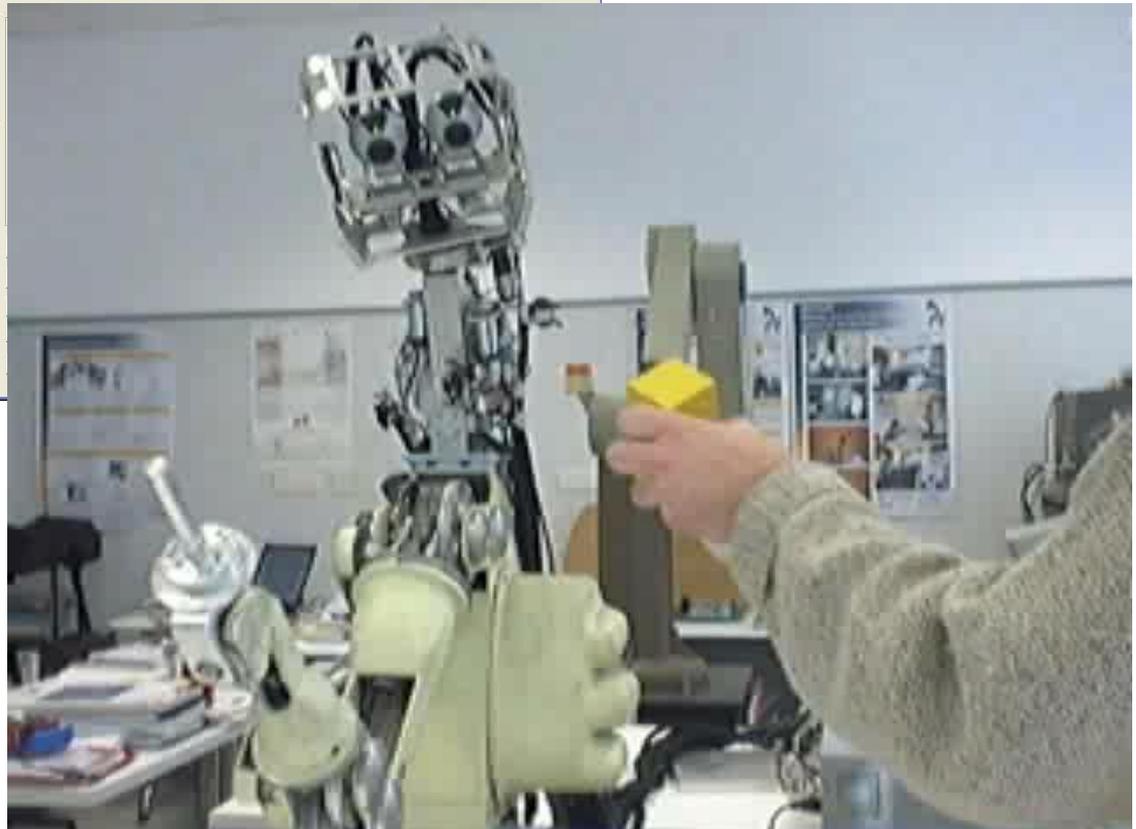

EYP_M , UP_M and LP_M are the range limits respectively for eye pitch, upper pitch and lower pitch axis

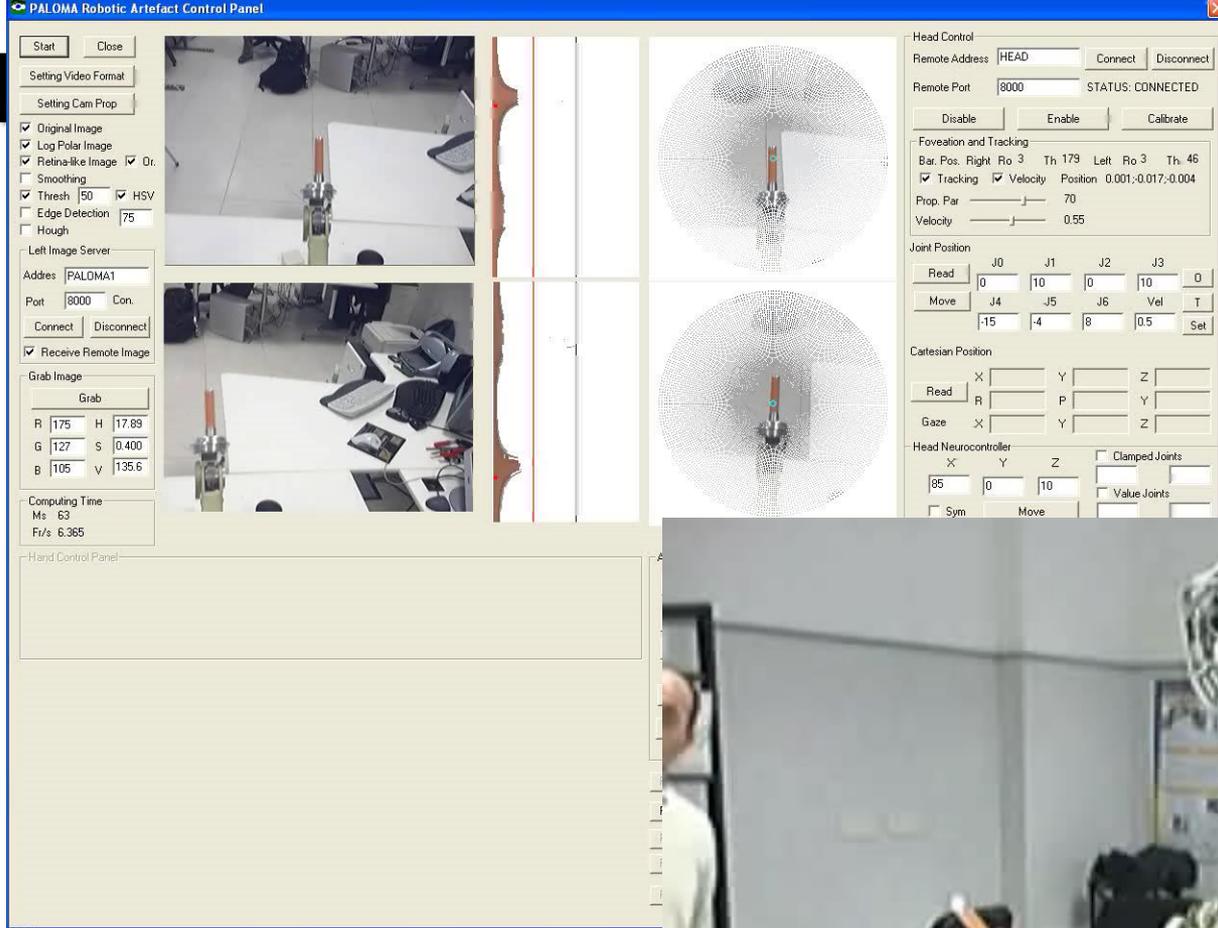

Pursuit Movement

Frame rate: 10 fps for both images
 Head Control loop: 100 ms

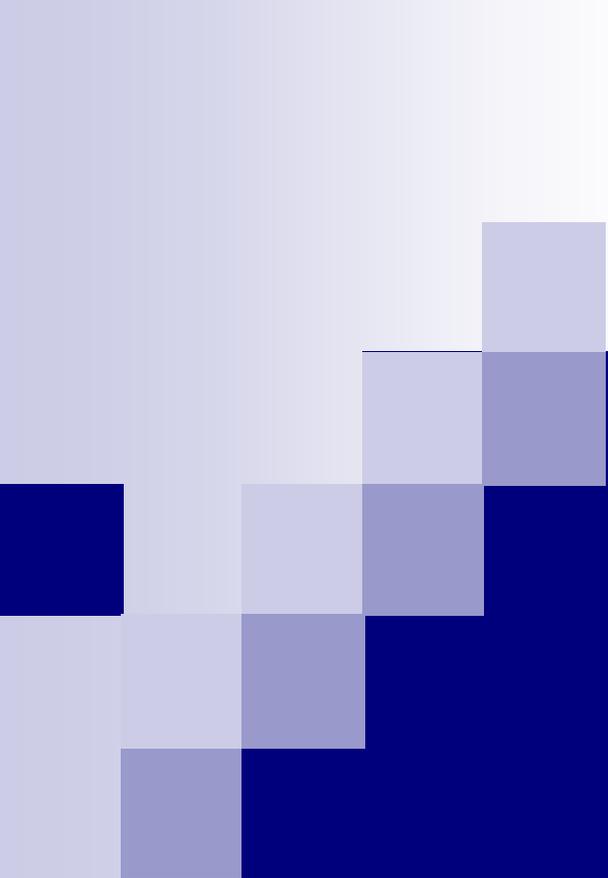

Hand Tracking

Frame rate: 10 fps for both images
Head Control loop: 100 ms
Arm movement 0.2 m/s

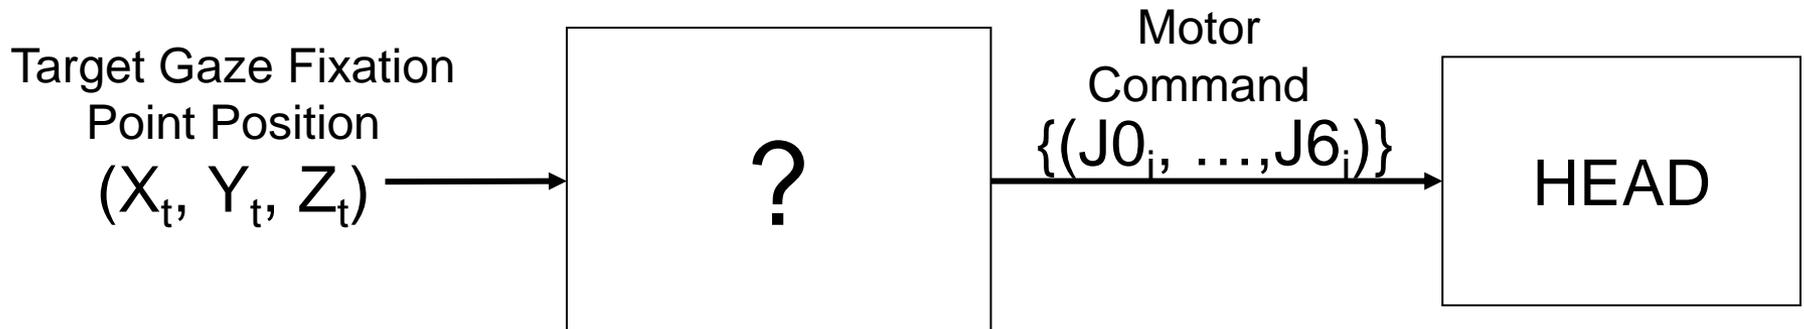

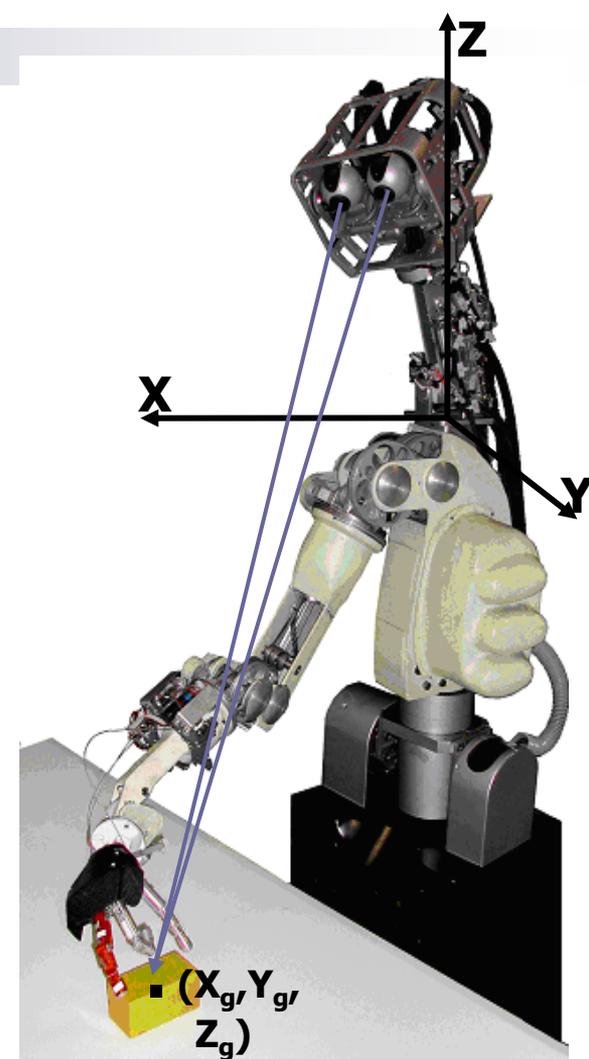

Solution 3

Implementation of a bioinspired model of head-eye coordination based on learning

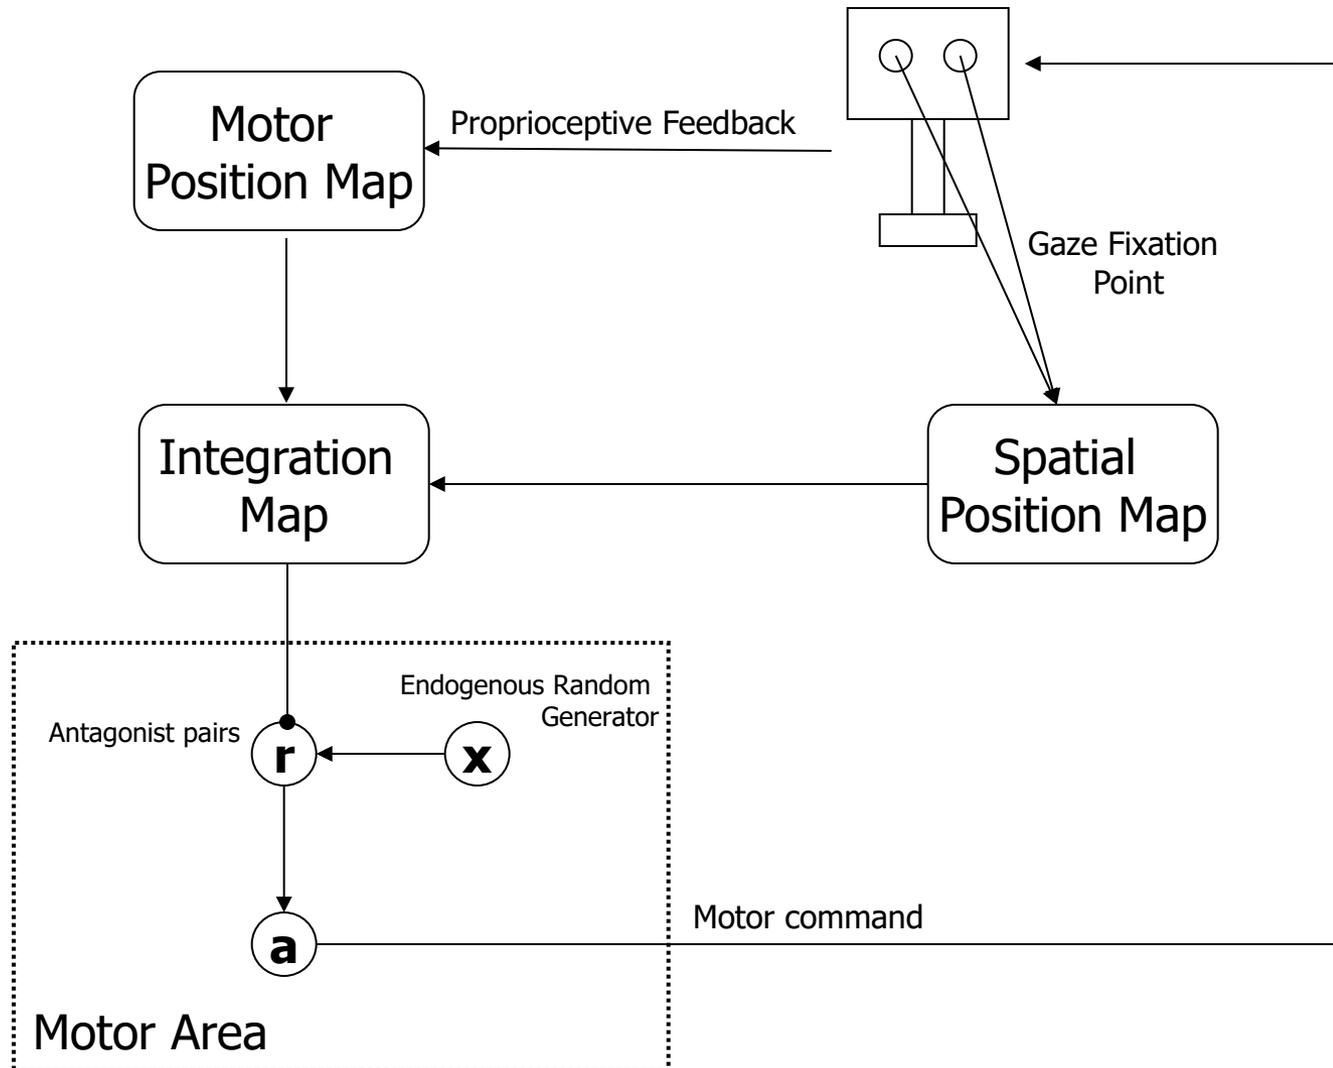

G. Asuni, G. Teti, C. Laschi, E. Guglielmelli, P. Dario, "A Robotic Head Neuro-controller Based on Biologically-Inspired Neural Models", *IEEE International Conference on Robotics and Automation – ICRA 2005*, Barcelona, Spain, April 18-22, 2005, pp.2373-2378.

Addressed Problem

To develop a control module that receives in input a target gaze position and provides in output a command sequence able to reach it

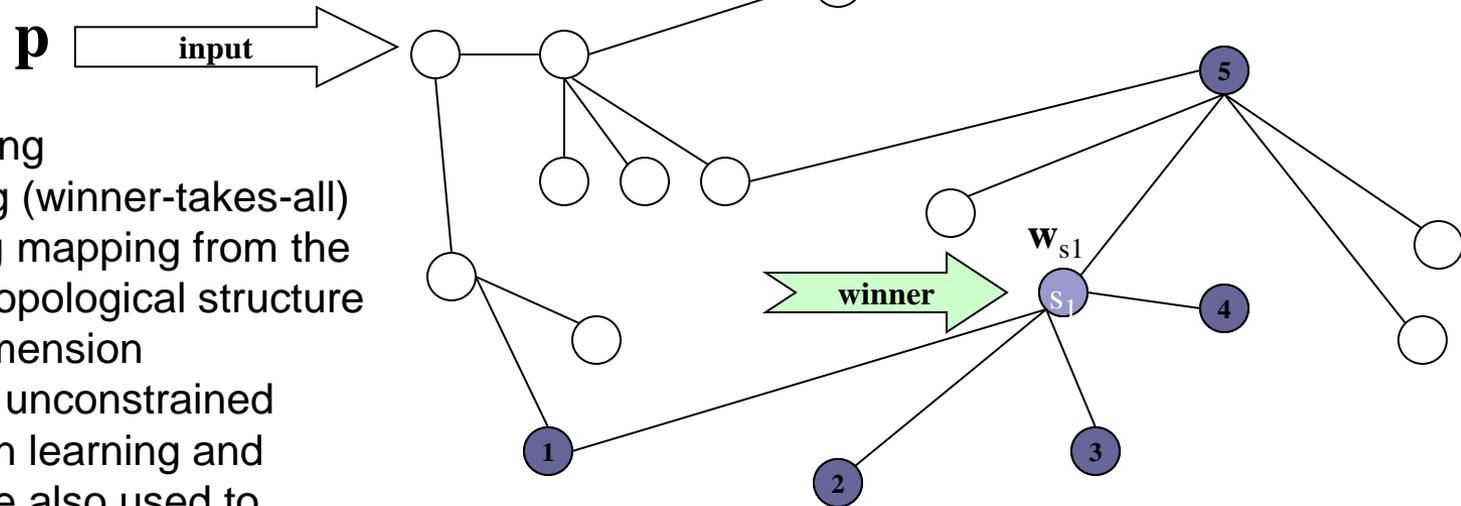

The proposed neural model

Implementation tools: Growing Neural Gas Networks

Visual GNG.exe

\mathbf{w}_i is the weight vector associated to the unit i

Set of direct topological neighbors of the winner unit (S_1)

$$N_{s_1} = \{ \textcircled{1} \textcircled{2} \textcircled{3} \textcircled{4} \textcircled{5} \}$$

Updating rules:

$$\begin{aligned} \mathbf{w}_{s_1} &= \mathbf{w}_{s_1} + \epsilon_b (\mathbf{p} - \mathbf{w}_{s_1}) \\ \mathbf{w}_i &= \mathbf{w}_i + \epsilon_n (\mathbf{p} - \mathbf{w}_i) \quad (\forall i \in N_{s_1}) \end{aligned}$$

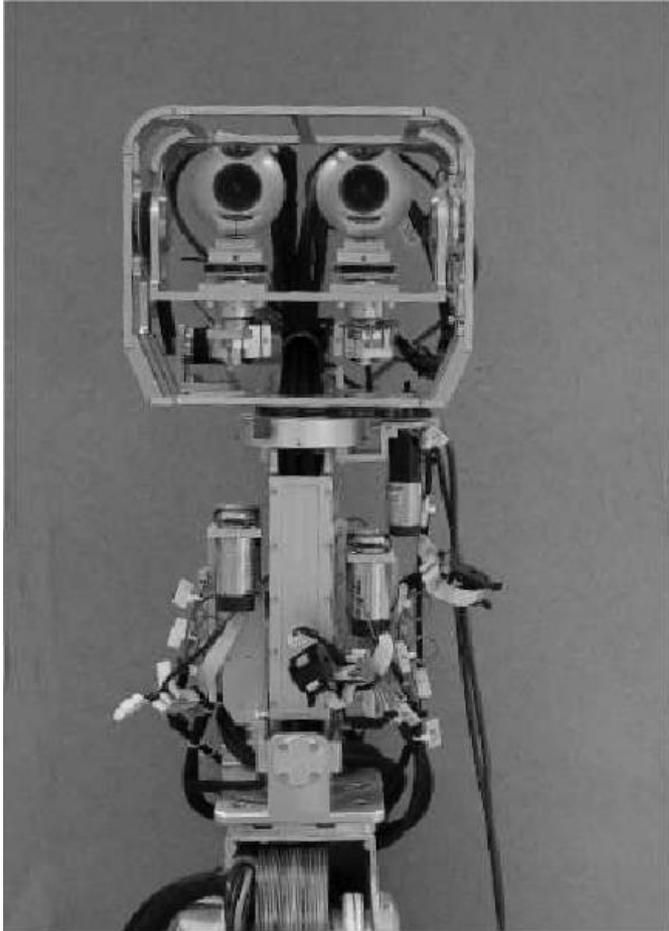

- Unsupervised learning
- Competitive learning (winner-takes-all)
- Topology-preserving mapping from the input space onto a topological structure of equal or lower dimension
- Network topology is unconstrained
- Competitive Hebbian learning and connection aging are also used to generate the topology
- Growth mechanism (the network size need not be predefined)
- The growth process can be interrupted when a user defined performance criterion has been fulfilled

Testing phase

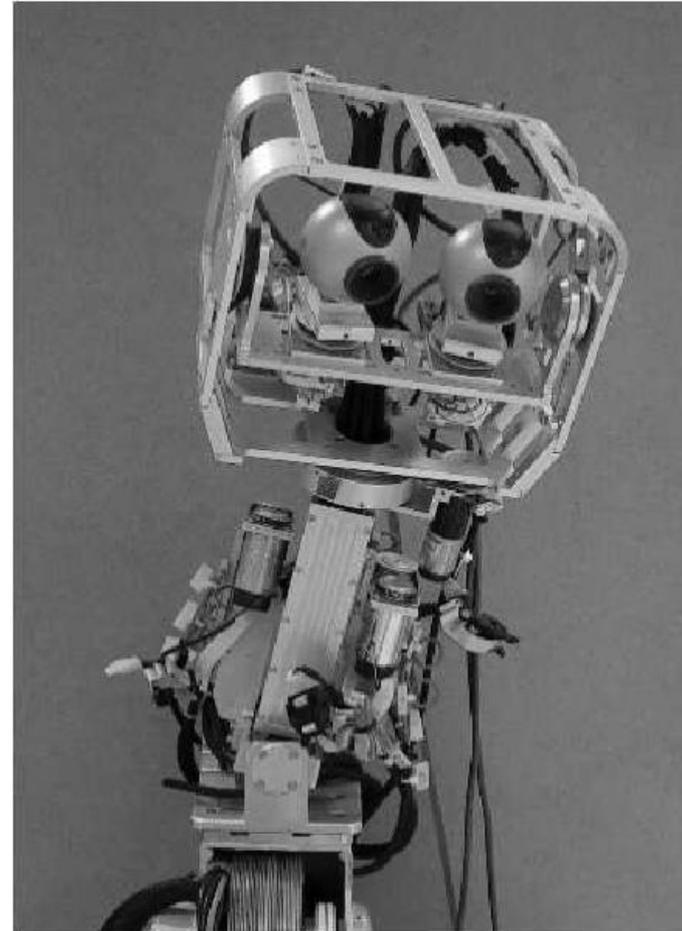

- After the training phase, given a target fixation point the system provides the joint rotations that drives the current gaze fixation point in the target point
- Three different modalities:
 1. Normal (without any constraint)
 2. With a clamped joint 0
 3. With symmetric angles for eye joints

All trials have been executed without additional learning

Experimental results: normal gazing

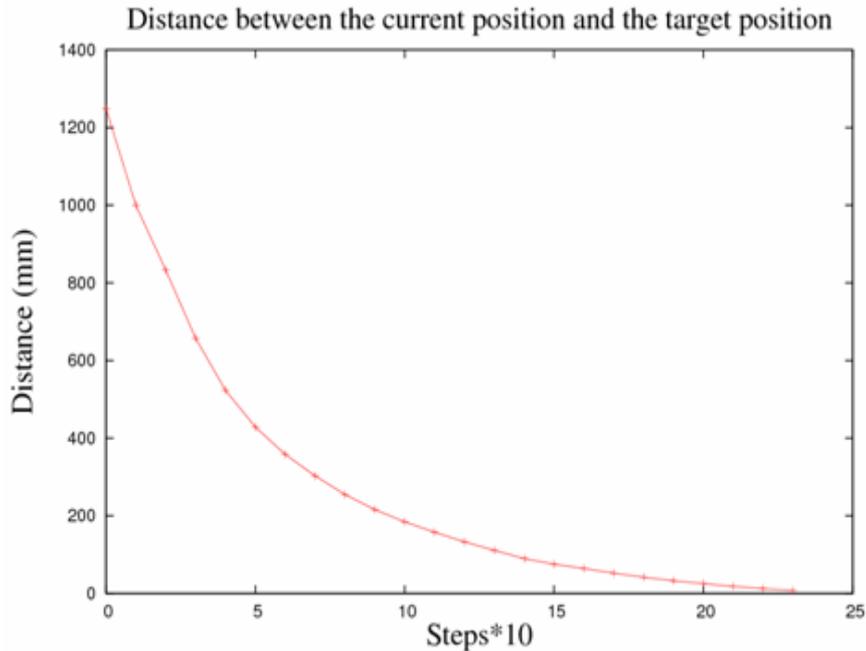

Initial posture

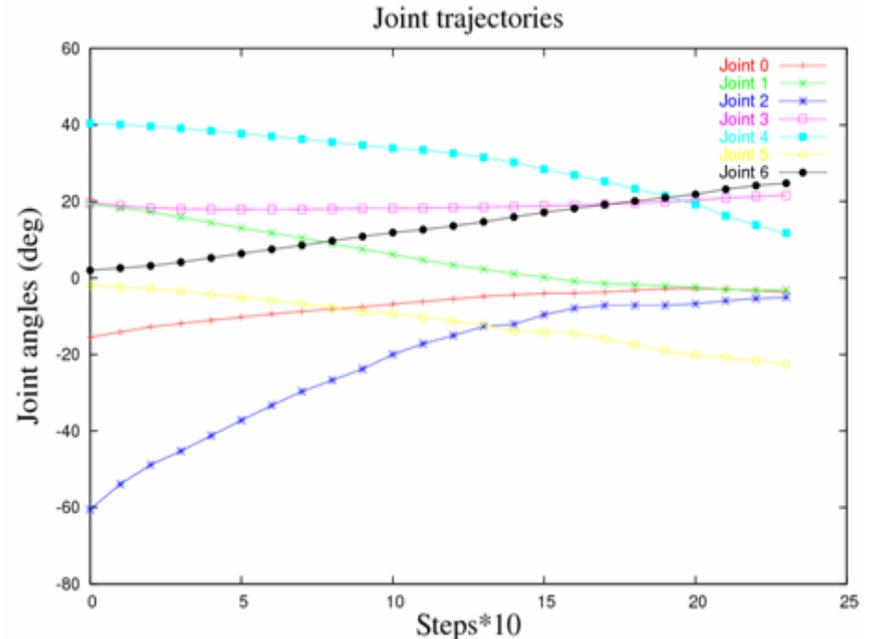

Final posture (normal)

Experimental results: robotic head (7 d.o.f)

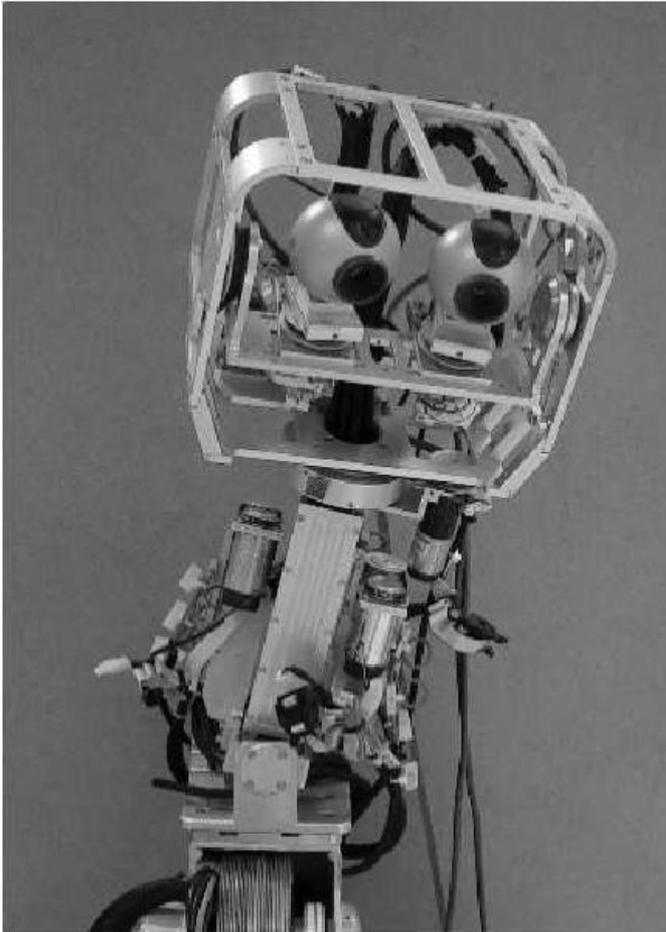

Distance between the current gaze
fixation point and the target:
monotonic trend

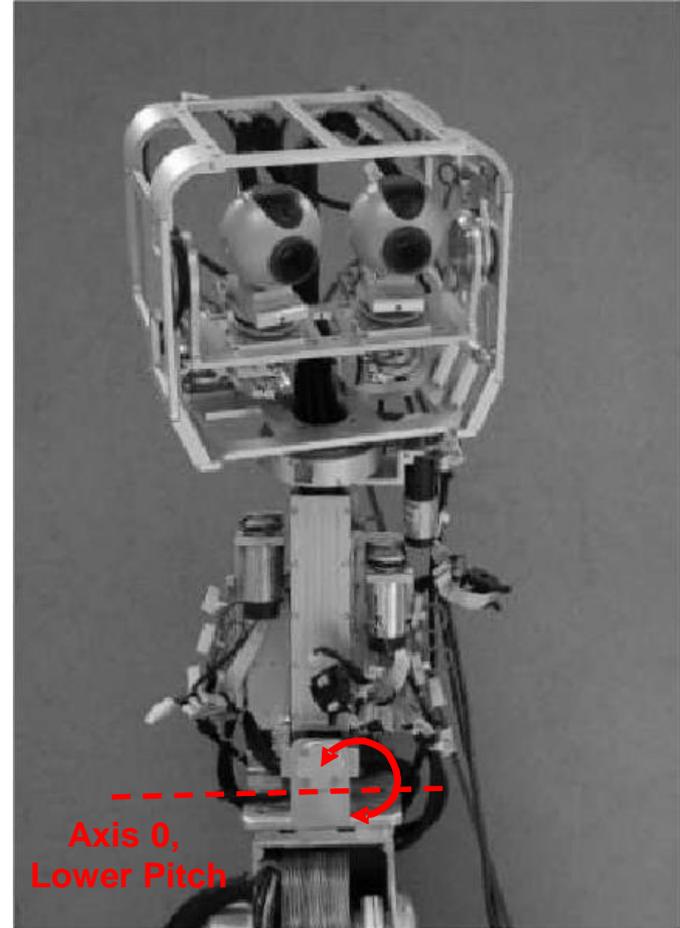

Joint trajectory

Experimental results: gazing with a clamped joint

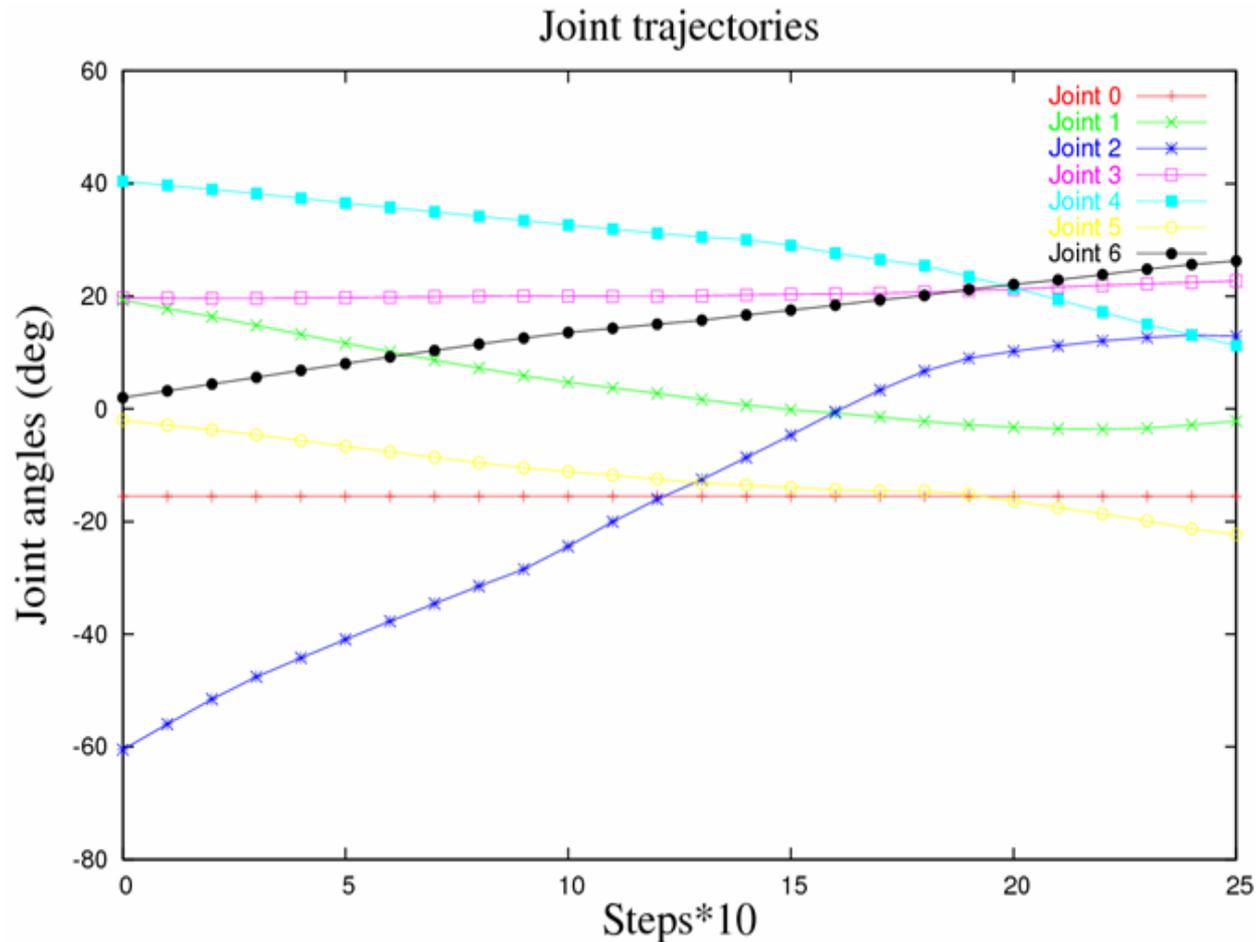

Final posture in normal mode

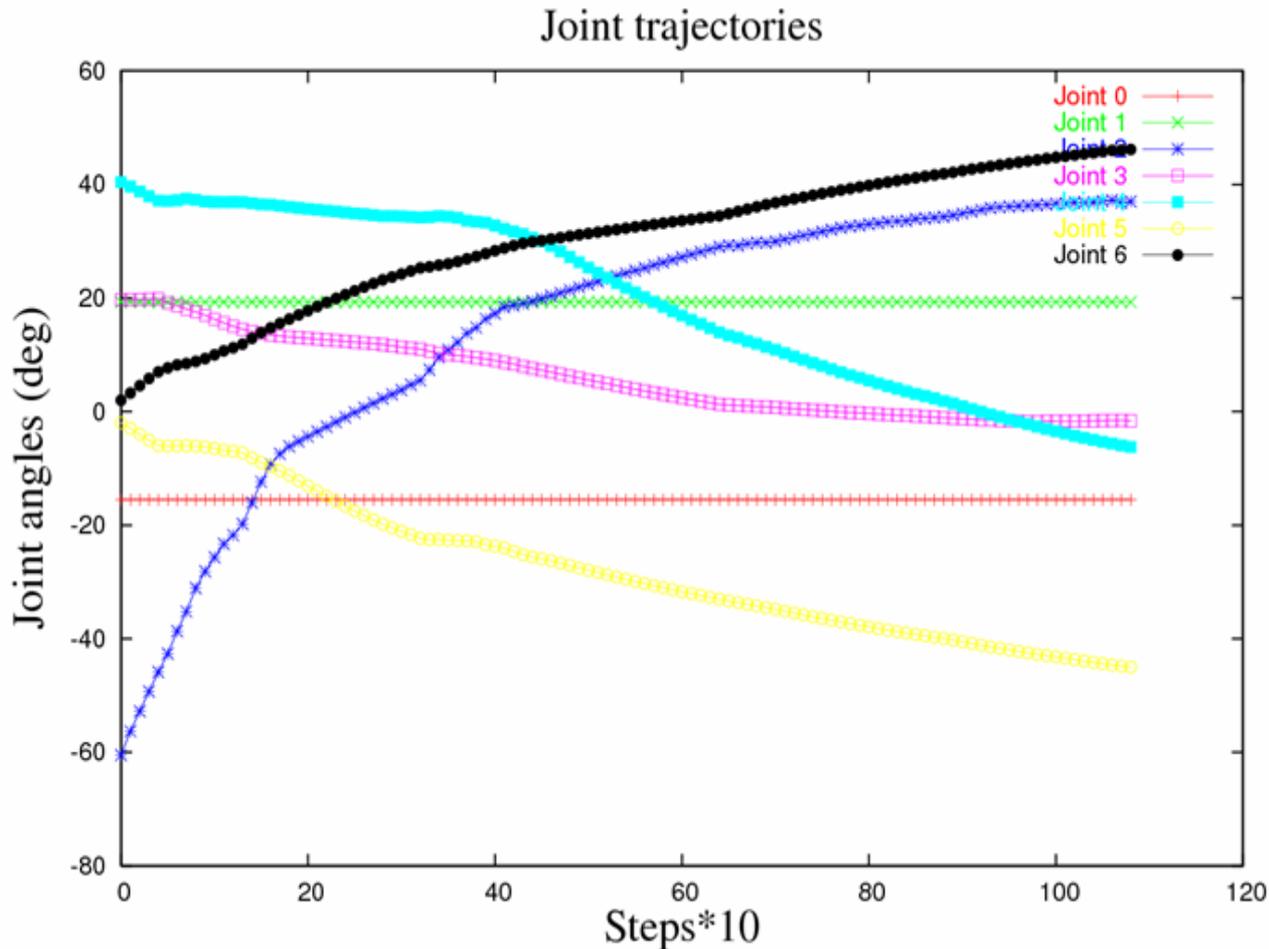

Final posture (clamped joint 0)

Experimental results: robotic head (7 d.o.f)

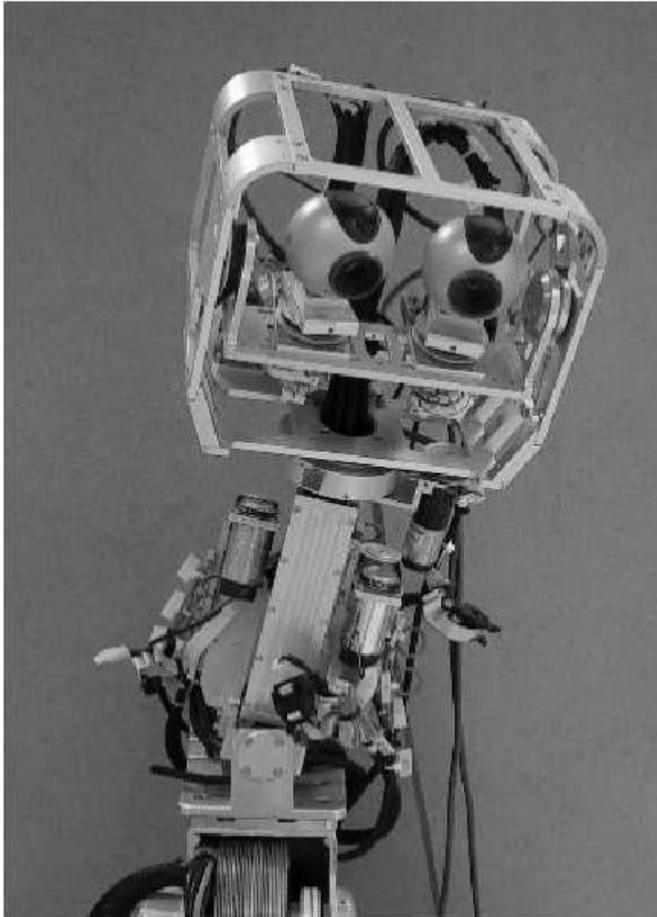

Joint trajectory: clamped joint 0

Experimental results: robotic head (7 d.o.f)

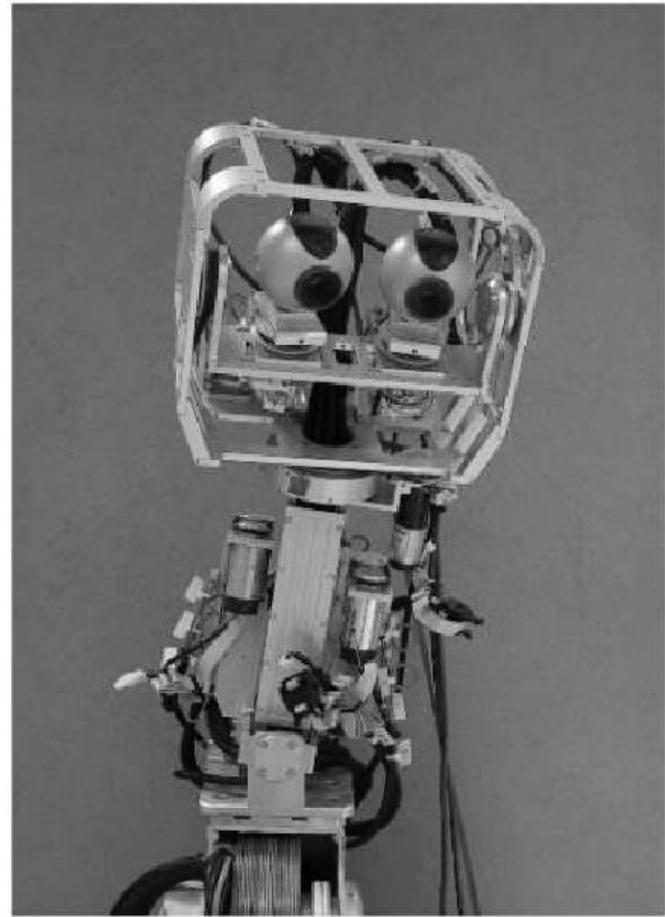

Joint trajectory: clamped joint 0 and joint 1

Experimental results: gazing with symmetric eye angles

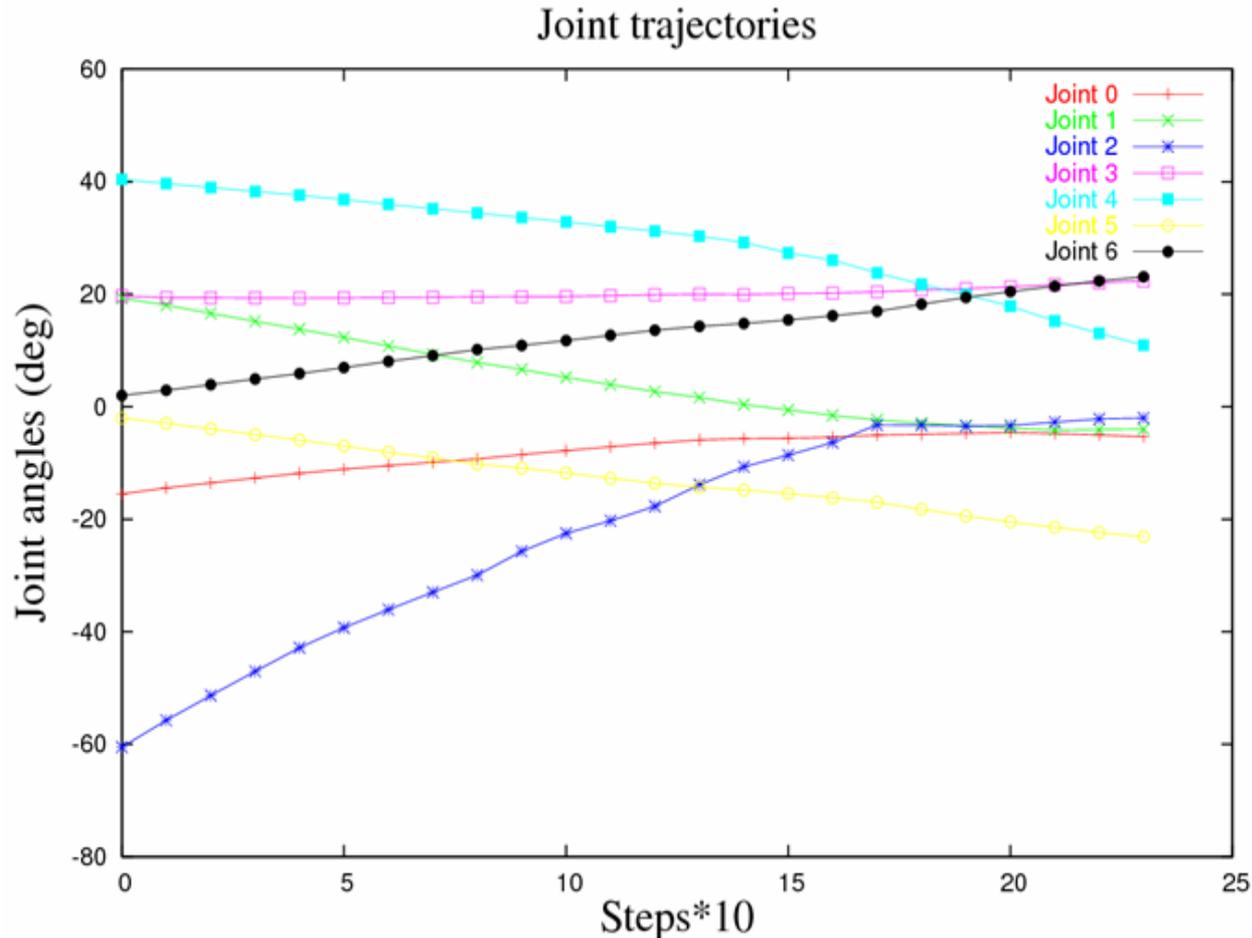

Final posture in normal mode

Final posture with symmetric
angles for eye joints

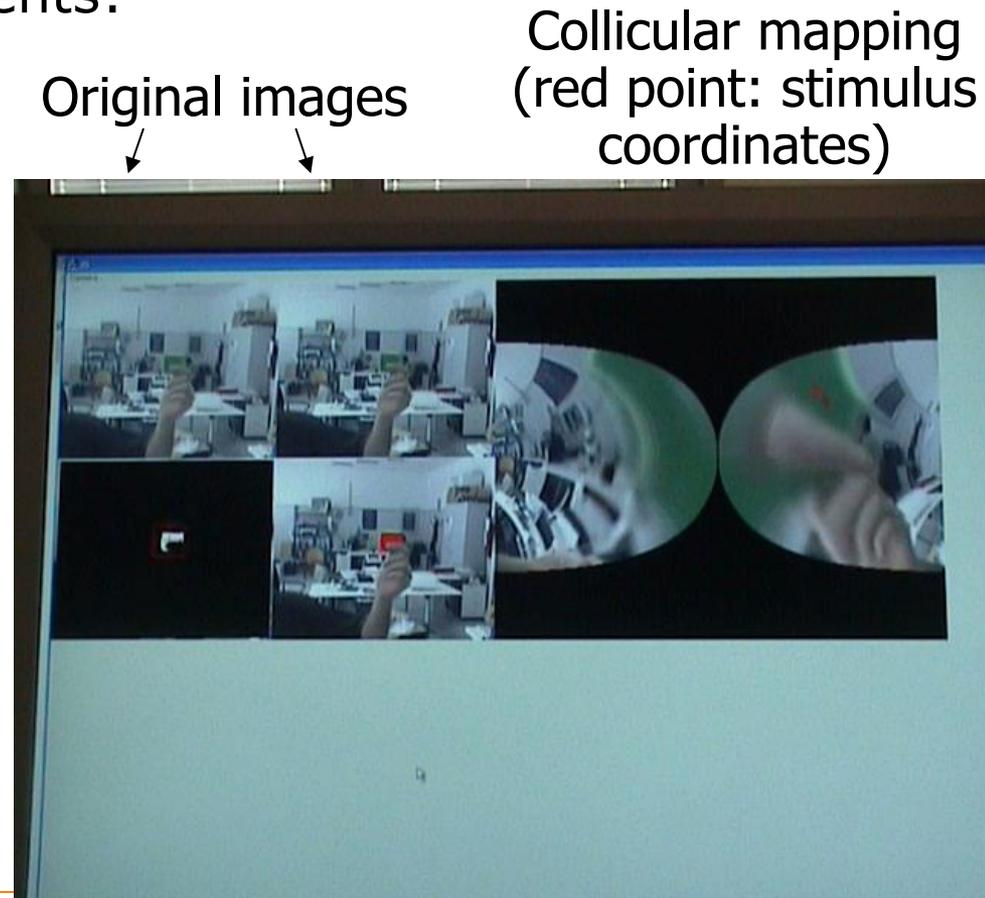

Experimental results: robotic head (7 d.o.f)

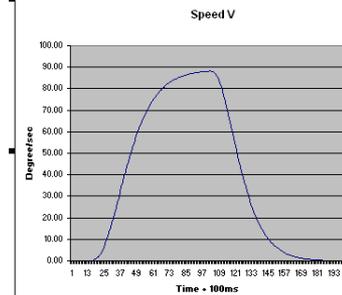

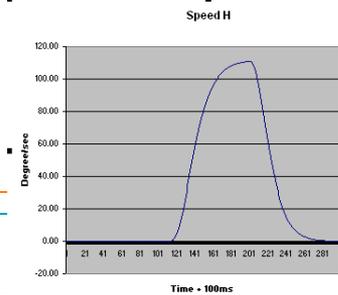

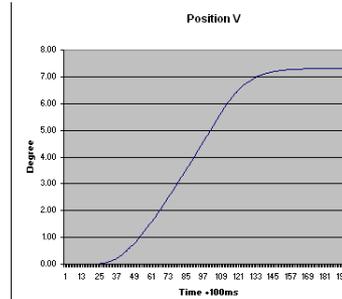

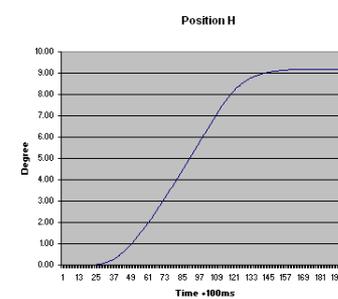

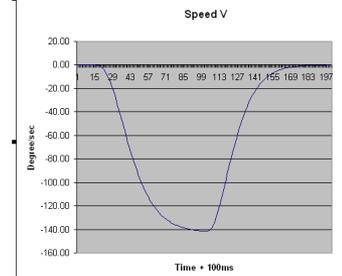

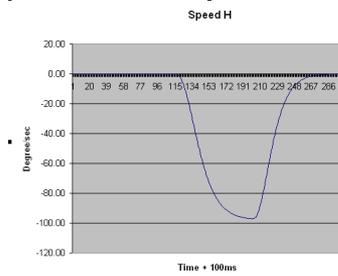

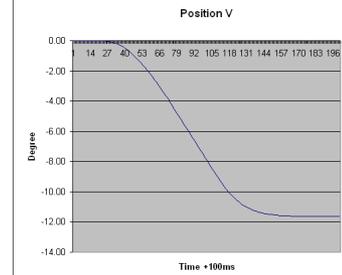

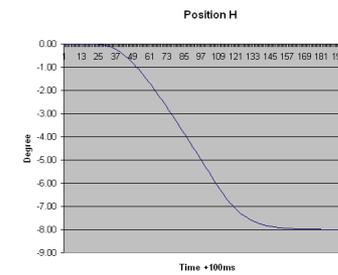

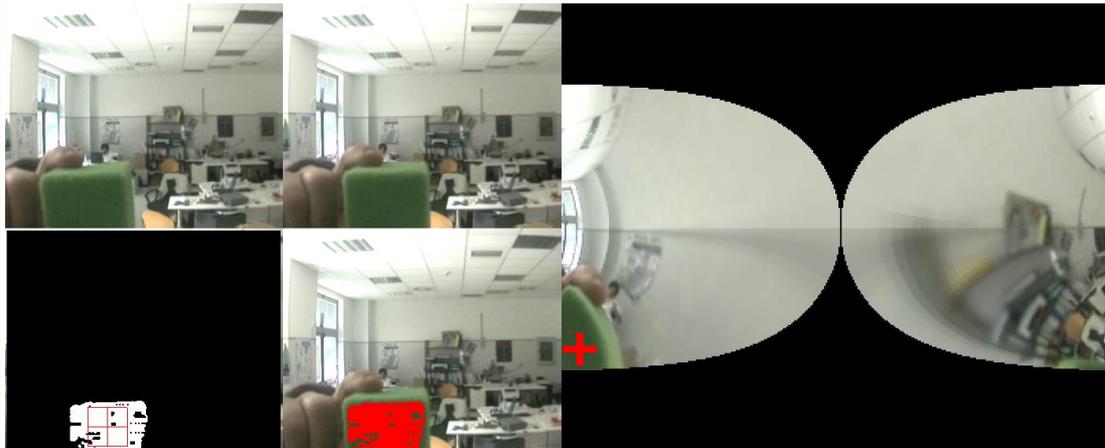

Joint trajectory: symmetric angles for eye joints (vergence)

Validation of a model of gaze control (by Prof. Alain Berthoz, College de France)

- Implementation of the mapping from the polar coordinates in visual space to the superior colliculus coordinates system, according to the model
- Generation of saccade movements:
 - A stimulus of a given colour can be detected in the map and the coordinates calculated in the superior colliculus, in real time
 - These coordinates are sent to the gaze control model to calculate the velocity profile for gaze control
 - The velocity profiles are used to control the robot head to generate the saccade movements of the eyes

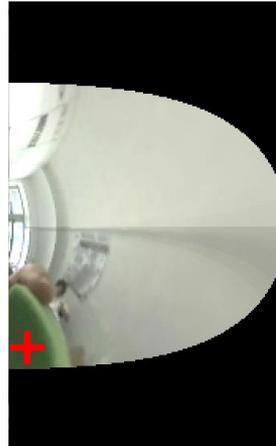

Generation of saccade movements

Generation of saccade movements

Stimulus #1

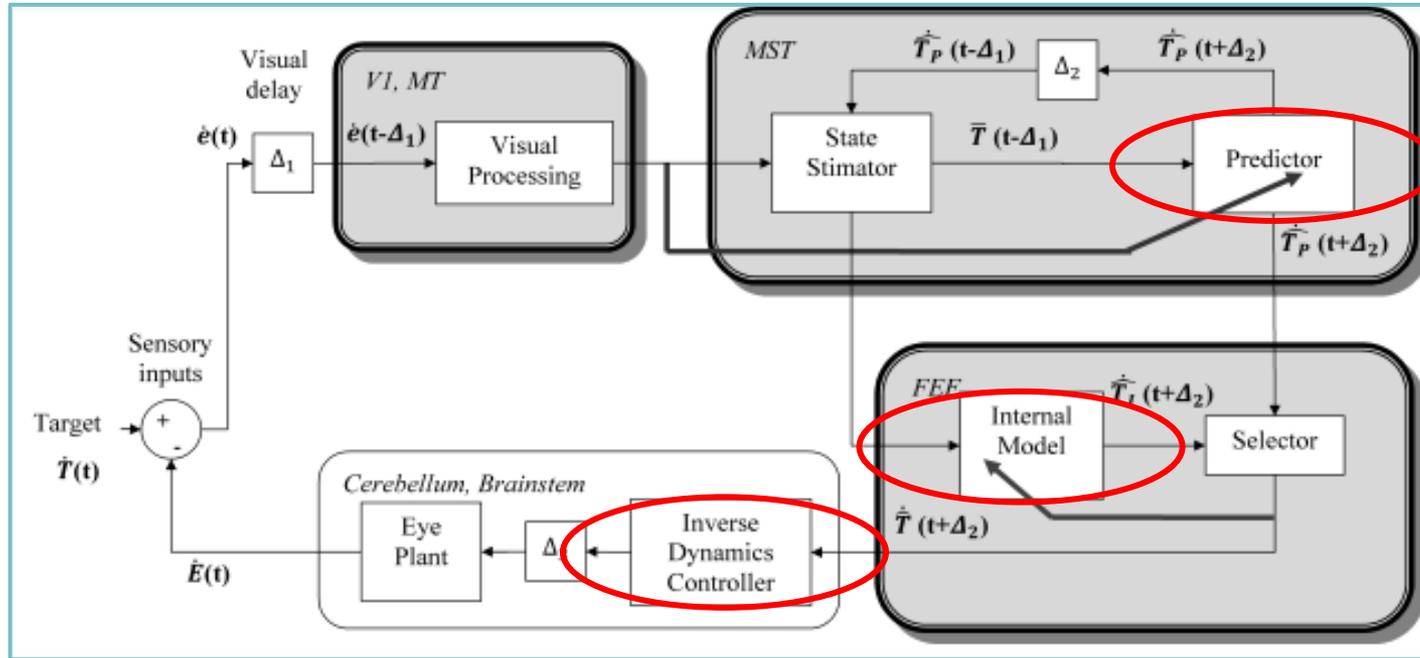

Stimulus #2

Saccades executed by the right eye

A predictive model for smooth pursuit

This circuit is based on Shibata and Schaal's model (*Shibata 2005*) of smooth pursuit and consists of **three subsystems**:

1. a **recurrent neural network** (RNN) mapped onto medial superior temporal area (MST), which receives the retinal slip with delays and *predicts* the current target motion,
2. an **inverse dynamics controller** (IDC) of the oculomotor system, mapped onto the cerebellum and the brainstem,
3. and a **memory block** that recognizes the target dynamics and provides the correct weights values before the RNN.

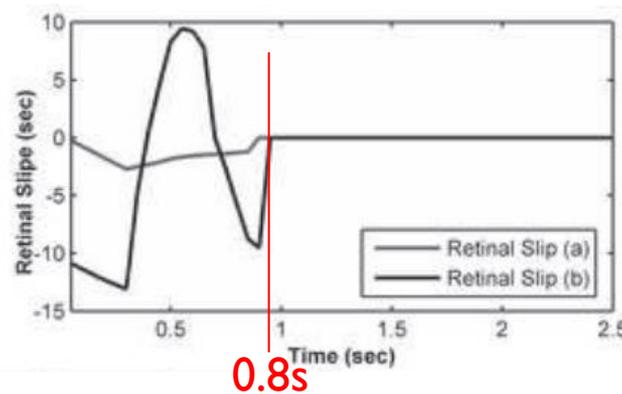

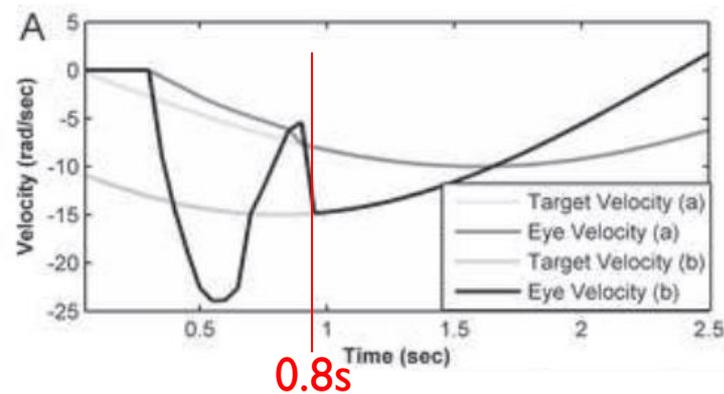

The predictive smooth pursuit on a robot head

iCub platform
head, 6 dof:
3 for the eyes
3 for the neck

The *retinal slip* (target velocity onto the retina) reaches zero after that the algorithm converges. When the target is unexpectedly stopped, the system goes on tracking the target for a short time.

Sinusoidal dynamics:
a) angular frequency:
1 rad/s, amplitude:
10 rad, phase: $\pi/2$
b) angular frequency:
1 rad/s, amplitude:
15 rad, phase of $3/4 \pi$

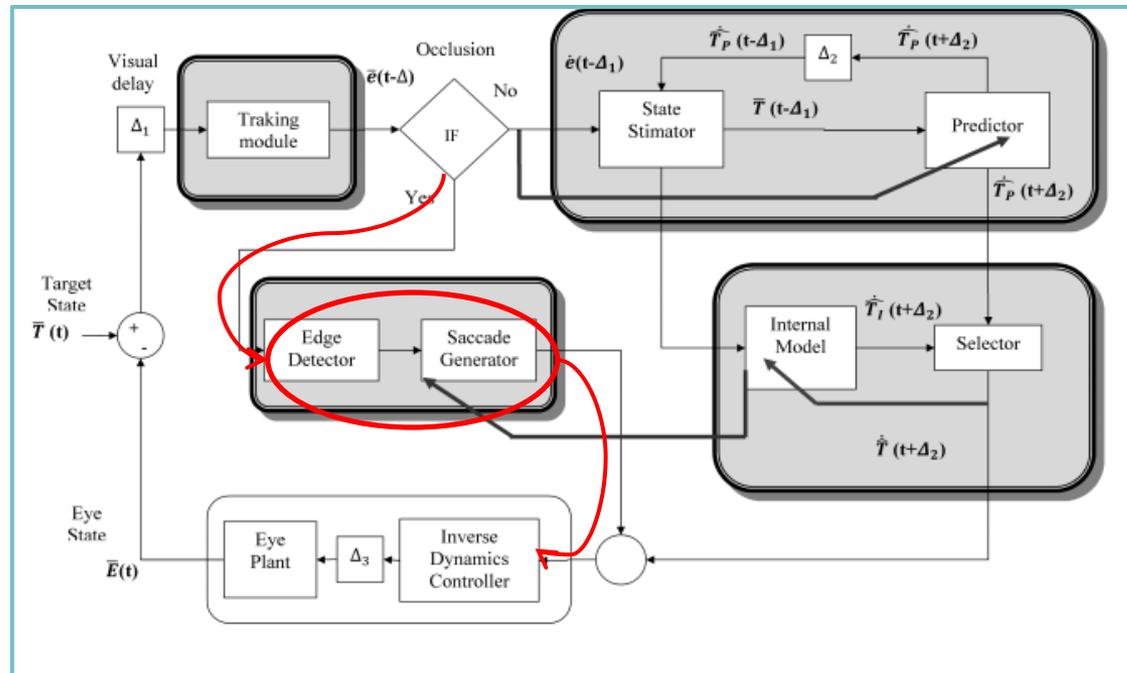

Smooth pursuit and occlusions

- ▶ Tracking across occlusions is not made with continuous smooth pursuit (von Hofsten, 2006)
- ▶ Humans are able to successfully track moving targets across occlusions by combining:
 - **Smooth pursuit** while the object remains visible;
 - One **saccade** to the predicted point where the object reappears;
- ▶ The saccade is elicited slightly before the target reappearance

A model of smooth pursuit and occlusions

If the object disappears behind the occluder an event of occlusion is noticed and another module starts to detect the edges in the image to find where the object will reappear. At this point the **saccade generator** module repeats the prediction of the target dynamics until the predicted position is equal to the edge detected from the previous module.

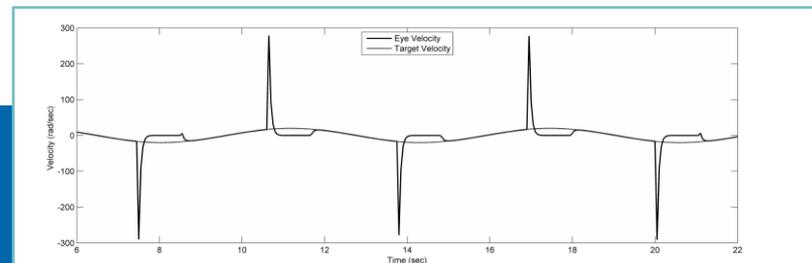

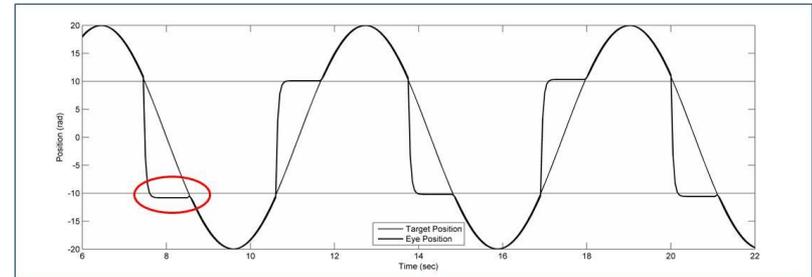

Implementation of smooth pursuit with occlusions

The tracking algorithm based on particle filtering detects the position of the target on the image and sends the results directly to the smooth pursuit system. When the target reappears, **the gaze points to the position of the target reappearance**, so the tracking algorithm is able to find the ball at the center of the image.

Saccades to the end of the occlusion

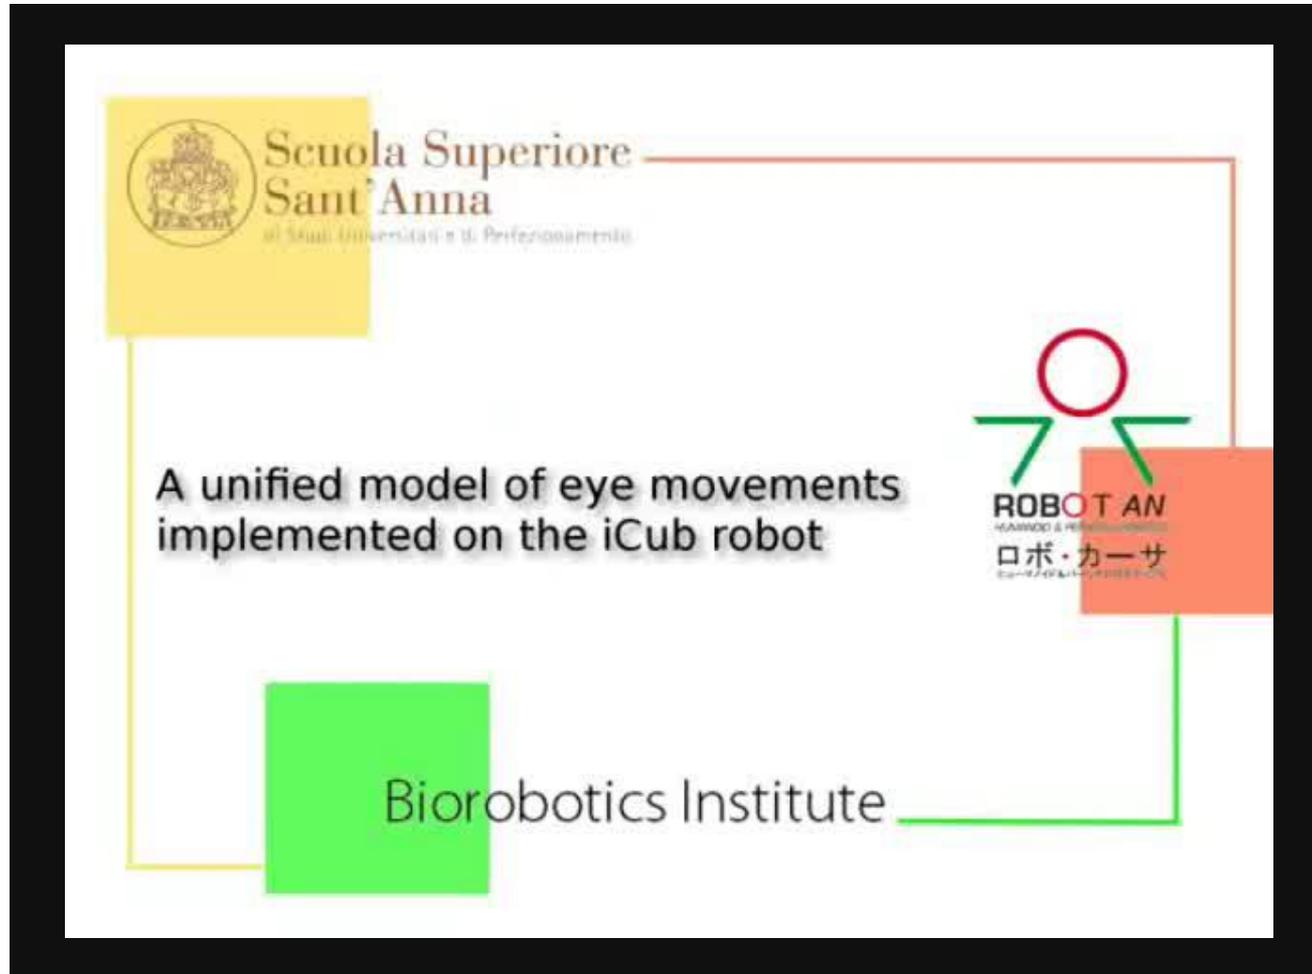

Punching a moving target - robot experiments

The prediction is iterated ahead 0.5 seconds
As the predicted target is inside the arm workspace, the robot executes a movement to punch the ball in the ***predicted position***

Robotic implementation of gaze control, integrating different eye movements
